Some Powerbooks (280, 520, 640) and some Macs (630, 475) have
68LC040s, but I don't thank any have EC040s.

>it a mix of technical mis-nmatch and good luck!

The internal drive is a DD floppy drive while your external drive is a HD floppy drive used as a DD drive. Confused?

A DD drive can only format to DD standard disk.
A HD drive can format to both DD & HD standard disk. What happens is that there is a LED and LED sensor (using light) to detect whether you placed a DD or a HD disk in the drive. And based on this info, it goes into DD or HD mode. So by blocking the light as stated in my previous email you trick the HD drive into thinking that the HD disk you inserted is a DD disk. And so it formats to DD standard.

I have done this numerous time as I format HD disk to DD standard for my ST before I got a HD drive for my ST.

Hope this clears up the confusion.

Do you have _any_ evidence for that? (Although the calculation above
[deleted by me] uses only integers, it's clearly a floating point
calculation.)

>the BlowUp/ScreenBlaster/FalconScreen software into the ROMS would be
>a good staring point, and wouldn't require any HW mods at all. Incorporating
>the BlowUP hardware internally should be cheap as well.

Blowup, Screenblaster and other boosters are not of very good quality.
Problem is that they do not produce enough Mhz:s and Hz:s (noninterlaced)
to get a sharp and stable picture in 1024*768 256 or 16 colours.

>A crucial move would be to ditch the awful ST style case, and go for a proper
>case - I happen to like the TT case, but just a reasonable clone case with
>space for some internal expansion would be good.

I would take any other case (even a 3-unit rack) than the one Falcon has now.
Main problem is the fan noise when you record audio near the computer.

>As to CPU expansion, what would really hot up a Falcon2 would be the
>addition of a 32 bit wide RAM option with a 32MHz CPU as standard.

I think this is coming, because eg. with Cubase Audio 2 the bus load
is always at it's maximum - and even accelerating the processor would
not give any more speed. As Steinberg is participating in the designing
(I was told by a Steinberg rep. many weeks ago that this C-Lab Falcon
is Cubase Audio Falcon compatible) they have free hands to address all
Falcons problems.

>I'm not waffling excessive pipe dreams here, as the core CPU hardware isn't
>the tricky bit to design, anyone could knock up a 68030 machine - it's
>the peripheral hardware that takes the time, and the falcon already
>has that in spades :)

I would be interest in inbuilt optical connectors and at least
8 RCA audio outs (also in's!)

>William I WILL STATE AGAIN IF IT IS NO CLEAR TO YOU, YOU *** CAN'T ***
>USE HD Floppy DISKS ON A DD ONLY DRIVE, IS THIS NOT CLEAR TO YOU...!!!

Of course I know if you format to 1.44M HD, you cannot use it on the normal ST DD drive. You need to reformat to the 1.44M HD to 720K DD standard before you can use it. The original poster did say he have reformated it to DD standard.

What I was trying to say here is that the disk may be reformated to 720K DD standard but there is a sensor in the drive that detects the type of diskette inserted and it will auto change the seek rate and data transfer rate. If you don't block the sensor, it thinks that you have a HD formated HD disk inside and so changes to the HD mode. If you block the light, it is tricked into the DD mode, even if you have a HD disk in it.

>3 1/2 Floppy drives DO NOT USE LIGHTS AT ALL, they use PINs with switches,
>Please don't post false info, as it only Confuses people here...

Sorry, but I have engineers friends in floppy drive companies that verified the existance of these sensors. A lot of problems arise from these because they can get dirty and impair the sensor so the drive going to the wrong mode of operation. Would be a bit difficult switching PINs if you change using HD disk to DD disk and then back to HD disk each time, no?

Well, then again, you somewhat right because the drives inside ST are only DD and so they don't have that LED/sensor thing. All newer and PC drive have.

Counting words shouldn't be a big problem, I'd say, but who needs it?
Macros would be nice, indeed.
There was a discussion about a thesaurus on Mausnet (newsgroup Atari.Text).
The result was, that it's quite expensive to create one or to buy a
licence of the neccessary data.
Colour graphics will be supported in version 4, AFAIK.
A grammar checker is quite a difficult thing. Especially the German grammar
is somehow more complicated than the English. I haven't heard of a German
grammar checker that works *satisfyingly*. And since Papyrus' market is mainly
Germany...

>On the other hand it has the best interface and an excellent font panel.

That's true. I love the interface. I would'n buy a WP with a 1000 more features
but an interface like MS-Word.

Andre

: Atari Man (atariman@aol.com) wrote:
: : The Atari Jaguar is the best investment I've ever made! I had the chance
: : to see the much touted SNES Donkey Kong Country over the weekend. I have
: : to admit its cute, but the SNES itself is far inferior to the Jaguar. I
: : firmly believe that Atari has a one year jump on the comptetition and they
: : are determined to STAY in that position from this point forward. Tell
: : your friends that they no longer need a $2000 PC to play DOOM, we have it
: : for our Jag's, IN our living rooms, on our 27"+ SVHS TV's and in FULL
: : surround sound! Way cooler than 14" PC monitors! Tempest 2000, Alien vs
: : Predator and DOOM are reason enough NOW to invest in 64-bit future power.
: : Tell your friends that more software is on the way. Guess I'm just one
: : happy camper... And the $149 CD-ROM player is coming soon.

: Well there are problems, The Atari Jaguar will mostlikely not make it at the
: the end of 1995 or the begining of 1996. Tempest 2000 and Doom are also PC
: games as well now (Tempest 2000 was anounced last month for the PC), Aliens vs
: Predator (wow, a Wolfenstien clone, big deal), I can modify doom to do Aliens
: Vs Predator, its a simple hack, in fact with my scanner, I can take pictures of
: your AvP and scan them in and use them in Doom or Doom][, Wow! Also for 90 US
: dollars you can put the PC's video to a 30 Inch TV, but my question is why? PC
: 's can also do more than play games, a lot more things than play silly games,
: thats why you get more and therfore have to pay more, games are a plus for the
: PC, but there is more to life than just to play games.

: The Jaguar has been said to be 64 bit, but I really doubt it, I really thing
: think its just hype... I dont care what Atari advocates say, I just dont
: believe it is 64-bit, if it was it would be more expensive and more powerfull.
: The 3-D games it plays now should not be bogging down the game system, but yet
: they are, if the Jag was TRUE 64-bit, it would fly through all the graphics and
: such, but sadly its not much faster than a 486-25....

: Don't believe the hype!

Well you doubt the JAG is 64 Bit, Well you are in fact correct!!! It's
two 32 Bit processors running in paralell, but as for it only being as
fast as a 486/25 I don't think so. And lets look at doom shall we, The
aliens Patch for the P.C is not quite the same as Aliens V Predator due
to the fact that it only gives you Aliens!!! You cannot control any of
these only remain as the set character which is effectivly the marine in
Alien V Predator, The weaponsare no where near as cool, Where are the
differnt views like the ones you get with the predator?? Regarding
GRAPHICS the P.C version of doom goes quiet blocky when you are close up
on somthing like a wall or an enemy character even in high detail, On
Alien V Predator you can walk right up to the walls and they still look

better quality than the walls on P.C doom do from a distance. As for scanning in the graphics and doing a P.C Alien V Predator??? What are you talking about, If it was so simple how come there are so little good Home-Brew WAD files around??

In future you should get your facts right before opening what ever orafice you use to talk from, because regarding this matter you are talking out of you rectum!!!!!!!

5248. Hard&Soft AT BUS Card

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 14:12:05 UTC
From: hofer@iam.unibe.ch
Message-ID: <3cka3l$f2a@aragorn.unibe.ch>
Source record: 174772

I have a problem. I have the Hard&Soft TOS 2.06 ATBUS Card and it works fine on my ST. Now I bought a 2,5" HD (Seagate) and a 2,5 IDE cable. The problem is, I can't connect my HD to the card, because the cable doesn't fit in. The card has a 40 Pin connector (male). Which cable do I need to connect my HD to the AT BUS card?
Thank you for helping...

Sacha

5249. ICD FaST HD case, ps, SCSI host $50

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 14:16:35 UTC
From: selick@acs2.bu.edu
Message-ID: <3ckac3$g76@news.bu.edu>
Source record: 174773

Hello! I recently inherited a hard drive system for the Atari ST which does not work. The drive mechanism itself has too many bad sectors to use. I have successfully used an MFM drive with this system, so all else is fine. The case can handle 2 3 1/2" hard drives, or 1 5 1/4" half height drive. Works with mfm or scsi drives (the mfm controller board is screwed into the dead 40 meg drive, which I will leave in there for you to play with if you like). I'm in Boston, but will ship it if you pay shipping. $50 takes it.

Call Steve Selick @ 617-782-2219 or e-mail selick@acs.bu.edu

I use Universal Item Selector 3, and have the tiny desk accessory installed
that can call it. It seems to fix the "disappearing mouse" problem that
some programs have, simply by calling up the file selector with the
accessory.

I would like to see Falcon, which has motherboard and power etc. which
would fit on *any* PC-tower-case. Minitower would be the best in
standard Falcon 2. Point is, that you can not fit even 1 SCSI-drive
inside the Mega-case (and with D2D you'll need several!).
I really would like to get rid of all external cases!

Is there any info if there will be more DSP's?

5254. Help needed with modem

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 15:54:06 UTC
From: ontarget@admiral.uucp
Message-ID: <Vo50wc2w164w@admiral.uucp>
Source record: 174777

Recently scrounged up a 4800 baud modem in a liquidation joint
for $5 and thought I would give it a try. Although it seems to be in
working condition and partially responds (dials, transmits data,
displays Terminal Ready signals, etc.), I haven't been able to connect
with local BBSes and on-line services via my 520ST, Mega STe and
800XL. Since the modem (MultiTech Systems MultiModem 208) has one
receptacle and some unfamiliar DIP switches, I'm hoping some kind soul
here might help me adjust them and reach the 4800 BPS plateau.
The modem has the standard RS232 input on the back and has two
phone inputs, one of them labeled "Dial Line" (which I assume
corresponds to "Line" on most modems) and the other described as
"Leased Line or Telset." I assume the latter is a LAN input. Most of
the indicator lights on the front panel correspond with most of those
I am used to (Atari, Supra modems). There is a voice/data switch on
the front, but it doesn't seem to toggle; rather it feels more like a
reset button or switch that once pressed in either direction, defaults
back a center position. The following (DIP) switch summary is provided
(* indicates standard factory settings):

8-switch bank -
1 * (UP) DTP dependent on interface / (DOWN) DTR Forced on
2 * (U) Internal clocking / (D) External clocking
3 (U) CTS Time Long (150 ms) / * (D) CTS Time Short (50 ms)
4 * (U) Scrambler Out / (D) Scrambler In
5 * (U) Enable Auto-Answer / (D) Disable Auto-Answer
6 * (U) CD and DSR Normal / (D) CD and DSR Forced (RS232 pins 6 & 8)
7 * (U) No function / (D) No function
8 * (U) Data Mode / (D) Command Mode

4-switch bank
1 * (U) Test mode enabled / (D) Test mode disabled
2 (U) 4-wire / * (D) 2-wire
3 * (U) Synchronous operation / (D) Optional - 4-wire async.
4 * (U) Dial-up operation / (D) Leased line operation

I'm not sure about the 'EC' designation, but many lower-cost Macs make use of an 'LC' 040 which is sans the built-in fpu. Why? Because it costs less and uses less power (and hence, generates less heat) than the 'full' 040 chip. These are important considerations for notebook computers, especially.

Whoa, hold on there, Iain. That statement is a little bit misleading.

C-Lab and Atari have signed an agreement granting C-Lab certain rights
in regards to utilizing Falcon technology, but do not OWN those rights.
This implies that Atari has sold all interests and rights in the Falcon
which is not the case... they simply -licensed- it to C-Lab. That's how
I read the press release from James Grunke at Atari, anyway.

In any event, it will be interesting to see what C-Lab comes up with.

Darek,
First of all, you know that I respect you from previous correspondence;
however, you're way out of line with your comment about "real computers."
I could give dozens of reasons why the Falcon is better than a PC
(for _me_) such as Newdesk vs. Windows, ease of use and software. People
_do_ have reasons for choosing the systems they do. If you feel that
you have to bash a particular platform then do it in advocacy.
The more I see my friends' experiences with IBM/Macs the happier I am
to own my Atari. BTW, did you see the talk about CLab making a Falcon
clone? Have you heard of the Medusa? Also, don't ignore the many 3rd
party developers that DO support our Ataris as well as all the great
people in the Atari community. The Atari is a very real computer.

>appeal to a bigger market.

Bigger market???? Two times zero is still zero. I'd bet the main
reason there are '040 boards as opposed to '060 boards is that '040
boards have been implemented on other platfroms for much longer and
thus it is cheaper to reverse engineer an existing design than to
start from scratch.

Such discussion is an inevitable consequence of posting binaries in
discussion groups, so it needs to be counted when tallying the true
bandwidth cost.

5271. Why should I buy a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 20:30:54 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELOIBBVGUp@stingray.manawatu.gen.nz>
Source record: 174793
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If I went out and bought a Falcon today,
what else would I have to buy with it?

Everyone seems to have accelerator boards - would I need to buy one as well?

Should I use a TV or SVGA monitor or even RGB monitor? I would like a
standard PC-equivalent resolution of 1024x768x256 colours (all my friends
have this from scratch, so it's no big thing).

From what I have heard, it appears that IDE drives are effectively faster than
SCSI in Falcons - so would I be better off getting a 540 Meg IDE?
I also hear that the Falcon has a 2 1/2" drive instead of the "standard" 3 1/5"
But I can fit one into the Falcon by removing the internal speaker?
It has an internal speaker then I presume? What happens if I remove this?
Would I lose any specific sounds? Or was it just put there in case you bought
a SVGA monitor without sound? Would I need to hack bits off the computer to
get this drive in?

Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
and more RAM ?

The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?

I realise I would be stuck with the keyboard attached to the computer *sigh*,
but understand that the keyboard is much better than the ST I am using now?

So basically, I would like to know:

Just what would the cost be, after I cover all the hidden (but necessary) costs
of buying a Falcon? I would dearly love to buy a Falcon, but if it is going to
end up costing the same as a PC (I can get an Intel 486 dx2/66, 8 Meg, 540 IDE
enhanced, SVGA monitor 1Meg video ram VESA[or something], soundblaster 16 bit
stereo, plenty of software free, Borland C++ for the student price -a third
of the standard retail price] - forgive me if I have missed anything).
Oh the computer is a Compaq Prolinear btw. (so it's not the cheapest PC).

The PC above would cost (last month's prices): $NZ3800 (about $US2400)
A Falcon (4 Meg and _NO_ HD, _NO_ monitor...): Approx.$NZ2100 (about $US1324)
not far off 1/2 price, but that's without a 540Meg HDD ($NZ500 - $US315),
a monitor (not too sure of the cost), and a whole bunch of software - C,
an Assembler for the '030 and DSP) and any GFA Basic update for the Falcon.

Oh yes, and cables too - some monitor cable to attach a Monitor (SVGA or RGB)
to the Falcon (at least I already have a SCART for a TV) - they usually cost
a fortune.

And ignoring the fact that there are a _lot_ of PC dealers in New Zealand - but _no_ Atari dealers - this is vital if I want to see software b4 I buy it rather than having to try get hold of an illegal copy, just so I can preview it before actually buying an official version from overseas!!!

I'm not trying to convert people to PCs (else I'd be saying this in .advocacy) as I myself _love_ ataris. But the problem is - is it really worth buying a Falcon? Please give me reason to buy one (next year when I have the money).

Thanks for reading all that,
Richard.

PS. Before anyone says it - yes I would have to pay more for a PC with MIDI, and a LAN - but I would never actually use those, so they don't really count.

I have a 1040ST with the stock 1 meg of memory and TOS 1.2 I am considering upgrading the TOS to 1.4 to improve my HD access and I was wondering:

1. Is TOS 1.4 the highest I can go without adding a TOS extension board?
2. If #1 is the case, what's the latest TOS I could run if I did install an extension card and what benefits would this get me?

Thanks in advance for the info...

Geoff Camp (geoff@damp.apana.org.au) wrote:
: Yes and no..... The internal DD drive on my ST (very old ST) will quite
: happily format HD discs to DD standard, and with no errors at the time of
: format and with no loss of data over at least 2 years. The external DD
: drive will not format the discs at all without lots of errors. I suppose
: it a mix of technical mis-nmatch and good luck!

HD and DD discs use different magnetic material on the disc itself, HD discs need a stronger magnetic field than DD discs, and HD drives have heads that can generate the necessary field. You are probably lucky in having a "better" head in you internal drive that generates a strong enough field for HD discs, you are even luckier that the data does not mysteriously fade away as the magnetism decays.

Some people may be able to use HD discs in their DD drives, but be aware that the failure mode is that the disc just becomes unreadable, and the data on it is lost forever - I hope you have backups!

>: is just a presumption). Would that create problems with current Falcons?
>
>No, all 680xx processors have adaptive datawidth. They can accept any
>memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

Actually the '040 can only handle a 32 bit bus according to what I've read
about it. The '060 is most likely the same.

>Motorola haven't sold so many 060's, (compared to 030-040) and is
>probably very expensive compared to them.

Well, right now the '060 is certainly more expensive, but I read somewhere
that they actually expected the chip to be cheaper to produce than the
'040, which could be nice...

Even if the '060 is pin compatible with the '040, it won't be possible to
simply plug it into an '040-accelerator card since they've lowered the
supply voltage to 3.3 (or was it 3?) volts.

>most developers until thay have made a 040 board.

And until the 060 is out on the market! (Is it out?)

>No, all 680xx processors have adaptive datawidth. They can accept any
>memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

Hmmm not true!

000, 010 does not have adaptive datawidth!

020 and 030 does!

040 and 060 has it, IF you are using a external chip called: 68150

the 060 CPU has 32 bit wide data/address bus!

>Motorola haven't sold so many 060's, (compared to 030-040) and is
>probably very expensive compared to them.

I think Motorola had to rethink when APPLE said that they wouldn't have
any use of the 060, instead they consentrated on the PPC!

Still the CPU market for Motorola is quite small relative to other parts
of Motorola products!

>060 is faster, but I wouldn't fork out the money for it. To expensive and
>I don't need the power.

What! You always need POWER! (But if it's worth the money? Don't know!)

Perhaps this is true; how did Atari do it, though? How much money did
they put into AtariWorks, I wonder?

>A grammar checker is quite a difficult thing. Especially the German grammar
>is somehow more complicated than the English. I haven't heard of a German
>grammar checker that works *satisfyingly*. And since Papyrus' market is mainly
>Germany...

I've never seen an -english- grammar checker that made sense, let alone
a german one. In order to understand the grammar checker in MS Word,
you have to -know- the grammar (or rather the terms of grammar). That
has been my experience, anyway.

>That's true. I love the interface. I would'n buy a WP with a 1000 more features
>but an interface like MS-Word.

This is not very realistic, though. Writers will use the tool that does
the job the best. As bad as MS Word is (and it -is- bad) it DOES have
a spelling checker, a thesaurus, a dictionary, a grammer checker,
scalable fonts, a configurable toolbar, and about ten thousand other
features that can make your life easier. On the other hand, the
program crashes at least once a day for no apparent reason and has
some very serious flaws. The user interface is not perfect, or even
great, but it does the job and (with effort) can be customized
to meet your needs exactly. I hate it, but I use it every day at
college and would not switch to any word processor with less
power. (I hear Word Perfect 6 is good. I just wish my Atari had
one of these programs. Then I would enjoy using them a lot more.)

Though I'm not in the market for this machine - ISTM that 2 drives is *way*
over the top. With CD-ROM becomming more and more common, even the single
floppy drive will become underused.

Roland.

Nope - they're all 68LC040, a low-power surface mount version, 25 or 33
MHz. People would really scream if they couldn't use VM on their
PowerBooks. :-)

The 68060 has a 64-bit data bus, though it is still a 32-bit processor (just as the Pentium and PowerPC 601 have 64-bit data buses but are 32-bit processors).

Some facts needed:

1) Can DSP 56001 be used as a sound data packer (something like 4:1 compression ratio), like some PC expansion cards can ?

2) Can Falcon handle IDE CD-ROMs, 2 CD-ROMs, and over 500 Mb sized HDDs?

3) Are there any "Digital Diskjockey" -style applivcations existing for Falcon yet? Music from hard disk and CD-ROMs, mixing possibilities, etc..?

Thanks for any help!

Tommi

5289. eXtended GEM partitions

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 23:27:12 UTC
From: npetrlik@public.srce.hr
Message-ID: <3clakg$4hl@nippur.irb.hr>
Source record: 174659

Hi !

I have a MEGAFILE60 (ACSI), and for formatting and
partitioning I've used HDX 3.02. Before I've partitioned the
hard disc, HDX asked me to choose which partitions should
be eXtended (I choosed E,F and G, i think - BTW, i
partitioned him to partitions from C to H). Is it somehow
possible to avoid that eXtended GEM partitions choosing, or
is it possible to make only one eXtended partition ?
Not a trouble to me, but when using Spectre to make Spectre
partition, eXtended GEM partition Spectre recognizes as
only ONE SINGLE partition! ...
One more thing, all of my partitions are smaller than
15 MB and my TOS vers. is 1.04 (rainbow TOS).
Maybe other partitioning program could handle this ?

Thanx for the answers.

I hope I can get a MagiCMac-FAQ and a list with tested programmes to you
within the next couple of days.

>Well, if it is able to run the Tempus Editor, compatibility must be
>quite high :-)

I really don't know about Tempus and MagiCMac.

>(Tempus Editor is one of the finest pieces of software I've ever seen.
> Unfortunately not too compatible...)

To say the least. Works fine under a single-tasking OS and in standard
resolutios. But multitasking and grafics-boards seem to cause some problems.

Someone I was at the show with asked this, the reply was that at first the case would be the standard ST case. The reason for this is to maintain continuity, when Atari finally stop Falcon production (which will probably happen although when, who knows) and C-Lab take over they want to make it easily known that the Falcon is still going.

> As to CPU expansion, what would really hot up a Falcon2 would be the
> addition of a 32 bit wide RAM option with a 32MHz CPU as standard.

In answer to the 32 bit bus question the guy said that they would see what they could do, the technical team will have a go and see what they can do, I think it will depend on how difficult it is and how long it would take them.

>Marpet people? I need more RAM!

Hmm, yes, I know about these people. I bought one of their XTRAM boards from
Toad Computers in Maryland to upgrade an old 520ST. I guess it probably could
work ok- it seemed like a well-built board- but I couldn't get it to function
in the 520. Anyway, I'd recommend calling Toad or some Atari dealer if you're
in the U.S.- if not, here's the address for Marpet: Meadowfield Farm, Fellbeck,
Pately Bridge, Harrogate, North Yorkshire, HG4 1LU, UK. Tel: 44 (0) 423 712600
Fax: 44 (0) 434 712601. Heck, while I'm at it, here's the address for Toad:
570 Governor Ritchie Hwy, Severna Park, MD 21146-2925. Tel: Orders 800 448 TOAD Info 410
544 6943.
Hope you have better luck than I did...

By the way, if anybody has an ST of any description with at least 1 Mb of RAM
for sale, I'm looking to pay around $100. Disk drive not required, some
dings & maybe even damage ok, as long as the MIDI ports work. Of course, TOS
above version 1.0 would be a plus.

^^^^^^^^^^^ ^^^^^^^^^^^^^

Darek, there's a big difference between intelligence and wisdom!

Take a very _hypothetical_ situation.... Suppose a young lad, with a fair degree of knowledge, developed an application on his 8-bit Atari, which enabled him to use it as a 'blue box' (ie. phreaking). This would show a certain level of _intelligence_. However, to then post an article under his own name, on a public BBS, detailing how to do this, would show a complete lack of _wisdom_. (speaking _hypothetically_, of course ;-)

Now there may be 3000 reasonably _intelligent_ non-Atari users out there, using Gemulators, BUT if they gave up their Atari's to buy computers (real or virtual), that require a Gemulator to run something other than oversized overpriced and unneeded software packages from mindless conglomerates that shall remain nameless... then they didn't make the _wise_ choice, did they!

Just get them to join comp.sys.atari.st[.tech] and look at the "dream atari" thread that "someone" started.

In fact - perhaps they could give us an e-mail address and I'm sure that quite a few people would be able to send them some hints as to what to include. It would make their life easier - they wouldn't need to think of things to put in it - we'd tell them instead =8-]

Richard =8-]

PS. Why 040??? There _is_ an '060 - the first mistake they could make would be to use "old-tech" from the word go.

>
>Wrong again I have a 240meg in my Mega CASE....!!!

I had Moniterm video-card in my Mega 4 and I couldn't fit even my
Gerbil there.
You need several SCSI drives for serious D2D-work.

2Gb is the maximum for one drive, and if you're doing a whole album
you're need a lot more.

>>Is there any info if there will be more DSP's?
>
>To do what, make the coffee ???

Think before you write. One DSP can handle 8 tracks with one realtime
effect. If you had two DSP's you could have 16 tracks with 2 realtime
effects or 8 tracks with several effects. And you would be able to
build ASR-10 -clone inside Falcon.

>The Falcon is a very bad design, it will take many many $$$$ to sort it out,
>and nowing what the German prices are like it will cost some $4000us...

The German prices are the cheapest around.
I certainly don't see much bad in having a computer that can act as
integrated MIDI/Digital audio workstation with digital I/O and
ROM OS & SCSI - I think it's a good design compared to Mac (get expensive
cards for D2D) or PC (It cannot even be done as in Falcon).

What I've heard (from a nice chap from Steinberg), the new Falcon2
will be cheap and very powerful.

>it still has the stupid GEM/TOS OS, I think the best way is to forget
>about Atari clones, and go get a real computer that is supported...

Is there any special reason why you write to Atari-Areas?
I think it's clear that you're notes belong to advocacy-area - we have

heard such boring comments too much lately. See what's going on:
Medusa, Eagle, Falcon2....???

>The main Music/MIDI Computer here in NZ is the Mac, Atari is a dirty word
>here.....

Then don't say it anymore.

We were only given a verbal statement at the show. Is this press release
available anywhere on the net? I'd be interested in what it said rather
han some half remembered snatches of it.

> In any event, it will be interesting to see what C-Lab comes up with.

Sounds good.

5309. Help, is there a Midi playing Tracker Program ?

Newsgroup: comp.sys.atari.st
Date: 1994-12-14 09:51:24 UTC
From: jon_w@oldham.gpsemi.com
Message-ID: <D0sopp.IBu@lincoln.gpsemi.com>
Source record: 174680
Body handling: HTML body converted to readable text

Sorry that this is a repeat of an earlier message, but I don't
think the previous title reflected my request.

I am looking for a tracker program that accepts midi input allowing
the tracker to play like a sampler. I have looked at PROTRACKER
and OCTALYSER, they mention this facility in later versions. Are
these later versions around, if not could someone supply me with
an address where I could get the latest versions.

Jonathan

I don't think incorporating such a software into ROMs is a very good idea.
Except with FLASH-ROMs installed. I'd rather have that as an external
software.

>A crucial move would be to ditch the awful ST style case, and go for a proper
>case - I happen to like the TT case, but just a reasonable clone case with

Oh please. Use an industry-standard tower-case. Musicians might like to see a
19"rack-version.

>As to CPU expansion, what would really hot up a Falcon2 would be the
>addition of a 32 bit wide RAM option with a 32MHz CPU as standard.

Falcon RAM _is_ 32 bit wide. But A Falcon 2 should have standard SIMM sockets.
Preferrably 72-pin ones.

Atari GDOS can't do that but the CodeHead one Can, G Plus Plus or some thing like that, it has a ACC so that you can load the Fonts when you like...

But I am not 100% on this, may be some of the USA readers can help...

From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <Zg4Wet5.johnhechtman@delphi.com>
Source record: 174683

Many people hav emailed me asking for a valid email or snailmail address for C-Lab, since my post that C-Lab was taking over production/R&D on the Falcon computer. The only problem is, I have an obsolete address for C-Lab from the time before Emagic and C-Lab split. Can some one email me the right info and also post it here for all concerned? Thanks! BTW, this is NOT a rumor - the licensing to C-Lab has been confirmed by Atari. TOS lives!

2.06, which gives you a marginally better Desktop and GEM. There is a
third option, installing the TOS clone MagiC, but you will need more
memory to do this. It would be worth it, IMHO.

>Does anyone know, if one can use 2 CD-ROM drives connected to Falcon? Do the
>driver softwares support it? What problems might occur?

Sure why not. The SCSI-bus is capable of 6 devices. No matter what you plug
in. The *CD-Tools* driver from Germany is capable of driving as many CD-ROMs
as you can possibly connect.

>Does Falcon's IDE-bus support CD-ROM drives and over 1/2 Gb hard drives?

If you use a standard *IDE* CD-ROM e g. Mitsumi FX300 you should be able to
connect it. You'll need a driver for it, though. And again, CD-Tools comes to
my mind. AFAIK the only driver with support for standard IDE-CD-ROM.

Forget those cheap FX001D drives. They have a vendor specific interface.
You'll need a SoundBlaster to connect them or a special proprietary
controller.

I dunno about the .5 Gb drives. That should be a matter of the sofware as well.
But I'd rather go for an SCSI-drive anyway.

5321. Converting PS Type 1's into Calamus

Newsgroup: comp.sys.atari.st
Date: 1994-12-14 11:02:01 UTC
From: cb170@city.ac.uk
Message-ID: <cb170.787402921@radley>
Source record: 174690

Hi all,

I need to be able to convert Postscript Type 1 fonts into Calamus .CFN format, retaining the kerning and pair kerning info.

So far, the programs I've tried include:

Fonty: It doesn't convert the kerning/pair kerning across. I know there is a newer version out - does the font converter do kerning now?

Didot Pro: Old version - it loads the kerning and pair kerning info, but won't resave the kerning in the Calamus fonts. I suspect it's either a bug, or it doesn't like the 'Postscript Type 1 font' message in the font info. Anyone know if DA's Layout is better in this respect?

DA's Vector: Only converts to DFN format, kerning intact. But Didot still won't save the kerning in any CFNs (see above).

Avant Vector Font: Does convert the kerning info across, but it's corrupted - the kerning values aren't set the same as in the PS font (they're closer to the characters). It doesn't convert the pair kerning at all though.

So, anyone know of the best converter? What are Font Designer 2, and Type Art 2 like? Where can I get them? Any other programs I don't know of?

Many thanks for your time,

No, but modern GDOSes don't load all the fonts at once with the call,
so why not just use vst_load_fonts()?

The bitmap font format is the same as the Line A font format which is
the Atari Library manual, IIRC. You could hack something up to load
these into memory yourself and blit chunks to the screen.

This is wrong, the Medusa comes from Switzerland and is made and sold by
a guy named Fredi ASCHWANDEN (source: French "ST Magazine" - october 94)
The PAK68/3 accelerator was a project from the German magazine "c't".

Yes, that is very definitely possible. The user manual describes the whole
procedure. The procedure includes a modification of aes.inf (or whaterver that
configuration file is called).

Roger calm down and stop being stupid!

Provided one is aware of the slight risk with some drives not reading them properly,
HD disks work quite well in DD format. About half my floppy disks are HD and I have had
no problems whatsoever despite pushing them to 935K (84 x11 sectors). In fact the only
disks
I have had fail were DD disks about 10 years old that had spent a couple of years in the
loft.

>>The trick is to trick it to see a DD disk instead of a HD disk. Do this by
>>covering the hole at one of the corner, which is on the other side of the

>
>
>
>3 1/2 Floppy drives DO NOT USE LIGHTS AT ALL, they use PINs with switches,
>Please don't post false info, as it only Confuses people here...

Don't shout your own ignorance. Some are mechanical and some are optical
(a DD drive can't tell the difference anyway of course).

>
>What I was trying to say here is that the disk may be reformated to 720K DD
Roger is partially correct. Some DD drives generate too weak a signal to persist
in the new media used in HD disks thus they can be written to safely on and HD drive
as DD format but if written on a DD drive there is a slight risk that the stored signal
will not
read correctly.

>
>Sorry, but I have engineers friends in floppy drive companies that verified

Of the several HD drives in front of me some use pins the others use light sensors.

If you don't stop arguing about whether balck is white or white is black

It's not as if designing for the Motorola 68K family is difficult. The CPU's are much better designed than their Intel counterparts, so designing with them is that much easier.

Reverse engineer someone elses design? Why?

Nope, the reason for a 040 accelerator is simply that the 060 is to bloody expensive to buy at the moment (and may remain that way as Apple aren't using it as they have in the past).

Well, I don't know about the 'English language' restriction, but there ARE
places where 'netiquette' rules have been established. Try looking in the
news.admin.misc and news.admin.policy groups for starters.

What's the big deal? Put binaries in the .binaries groups and leave the
discussion newsgroups for the purpose they were intended. Why is that hard?

John Hechtman <johnhechtman@delphi.com> writes:

>Toad told me as recently as last week that they were awaiting new driver
>software from Marpet to fix problems with drive access caused by the X-tra Ram
>board. They said the sofware should be in fairly soon. What problems did you
>have when trying to use the board?

Well, basically, the machine wouldn't recognise the board. It came with a
disk, but there was no data on it, so I couldn't run the testing software it
was supposed to come with. The very first problem I had was with the initial
installment. Whenever I turned the Atari on, it would run fine for about 2
minutes, then it would crash with 2 cherry-bombs (bus error of some kind).
It always ran for exactly the same amount of time each time, and it always
came up with the same error. Resetting the machine only made things worse;
the only way to get it running again was to cycle the power switch.
I called Toad and they suggested that I move the SIMMs to the other bank.
The other bank, it turned out, was _broken_- the little fingers that hold the
SIMMs on crumbled at the touch, but I put the SIMMs on anyway, hoping that the
metal fingers would all make contact (I now suspect that pressure is required
to make the SIMM slots recognise the modules). This time, the machine ran
fine, but it still insisted that it had only 512K.
I rechecked the Marpet manual last night, and it claims that I had the SIMMs
in the right bank to begin with. So I moved 'em back to where they were, and
now the machine just flat won't recognise the board. It runs ok, but no
extra memory. I've tried turning off the internal memory bank, by disconnect-
ing the CAS resistors, but when I do that, the machine won't run - it just
thinks it has no memory at all. It's possible that I'm not using the proper
procedure for deactivating internal memory, but it's what they say to do in
the Marpet manual, and besides, the only other resistors I could find near
the memory chips are hooked to the multiplexed address bus.
Now, the computer I'm doing all this stuff to is an ancient beast. It's a
520STm (internal TV mod, external disk drive & power supply). It's had a
fairly rough life. Also, it has TOS 1.00 (copyright _1985_). The Marpet
manual does not come with instructions for this particular ST; they say that
the XTRAM board won't fit in the case (well, it does, just not very easily).
One thing I suspect is that the TOS version maybe is what's keeping this
thing from working. I intend to call Toad today and talk it over with them.
But it looks like the Marpet board may be heading back to Maryland.

- Michael Ashton

Hendrick,

how does MacMagic run on the Apple? I.e. does it run on top of
finder? If so wouldn't it be slower than a Medusa T40 (or even T60 for
that fact).

Also I realise that Mac's are cheaper than a Medusa, the T40
retails for 3,400 U$D. However what about speed? I.e. an equivalent Mac040
would it be faster or slower than the Medusa?

Cheers

The first article was published in ST Magazin 12 1992. This paper was later
absorbed by ST Computer so maybe you can get the issues describing the Medusa
project from them...

Christer.

>software/hardware...any help appreciated, M.C.

Well, the 520stfm has the equivalent of an AY-3-8910 sound generator built-in, and that thing can produce 2 kinds of sounds: square waves and noise. It's not even very expansive as far as that goes- it has one not-very-good noise source (pseudo-random digital, & personally I think it's a 1-bit loop), and only 3 square-wave generators. This means that the most you can play are 3-note chords.
I have heard that there are ways to generate PCM sound with the Atari. I don't know much about these, but that would greatly enhance your chances of doing what you want.
If you want anything above square-wave bloops, I'd suggest investigating the PCM possibilities, or (probably your best bet) getting a Replay cartridge. And of course, you could always get a different Atari. I think that the 1040STe has extended sound capabilities, and the Falcon has a 56001 DSP that can be used to generate probably just about any sound you want (within certain limits, of course).
Hybrid Arts has been out of business for a couple of years. Currently, a company called Binary Sounds is selling some of their products (including a new version of MidiTrack ST). Still, I'm not aware of a Hybrid Arts package that used the Atari's internal stuff to make noise. MidiTrack won't do it- it specifically says so in the manual. You are right about them making synth-related software & hardware, though; that was their primary business.

>Apple aren't using it as they have in the past).

I remember when Apple was starting to come out with 040 machines a few years ago. The first 040 Macs rolled out the door about 2 or 3 years after the 040 came out. There was alot of furor over that, because of course Mac users expected Apple to be able to come out with 040 Macs as soon as Motorola came out with 040's.
The problem was not with Apple, but with Motorola. Apple needed quantities in the hundreds of thousands, and Motorola simply couldn't produce that many 040's cheaply or reliably enough for Apple. It took them a couple of years to get their production lines to the point that they could make that many 040's. I expect that they will have the same sorts of problems with the 060. There are, of course, buyers for the chip, and Motorola, citing one example, has 060 VME boards, but these cost several thousands of dollars and are for very specialised applications. The 060 is not a mass-quantity item yet, and if that kind of demand doesn't exist, Motorola probably won't take the trouble to tweak the production lines to handle it.

Thanks for the clarification. I understood it to be that Clab had bought
the Falcon lock stock & barrel. The acoustics in the room where the
announcement was made were terrible though so I must have misheard.

> In any event, it will be interesting to see what C-Lab comes up with.
Indeed!

Michael James <895822ja@udcf.gla.ac.uk>:

> Erm, small point.
> international sales, but apparently STR was the most popular in the UK. (This
> is fairly recent.)

I don't think this is the case on several counts. Firstly, other British mags were also available internationally. And the only foreign market that could influence the figures substantially is Germany. However, foreign mags are traditionally obscenely expensive here (almost *3* times the cover price). STF sells for about 24 DM which is close to 10 pounds! So I don't think enough people could simply afford it to make any difference.

Besides, ABC figures on which my initial statement was based are done only for the U.K. anyway (numbers sold, that is - numbers printed, is universal of course).

So I'm afraid no matter which way one looks at it STF still outsold all of the competition combined.

The biggest problem with the STF (and other ex-Future publications) is that it is done by professionals. Don't laugh... I mean professionals as opposed to enthusiasts. STF editors are there only for a limited time (a year) and, the then, Future Publishing would play their traditional "musical chairs" with editors every January. Even the new owner seems to follow the formula so right now all of ex-Future mags will get new editors, most of which know very little about the mag they will be working on. And then (according to Murphy) just when they learn a little they are rotated again. Sure, the mags are done professionally (production-wise) but the management intentionally want editors to mantain a distance to the subject matter. And again, no matter what we think of the procedure it is a commercial hit.

I recently had an *infestation* of this virus on various floppy disks I had. Does anyone know anything about it?

For example what does it do?
Does it install onto HD? (I hope it didn't)

I managed to kill the virus on the floppies, but I am still a bit worried about in being on my HD. I ran AVK_3_6 on the HD but it said everything was ok. Is there any Virus detectors/killers which are ram reisdent and run in the background?

I don't really want to, but I'm not really using the capablities
of the Falcon and I could use the money, so I'm putting it up
for sale.

It is a 4/84 model and includes the full package of software
included with US Falcons (Atari Works, D2D, AFM, etc). Had it
a little over a year and it is in perfect condition.

Asking $975.

E-mail me if interested or if you need more details...

A rack mount Falcon? Ooh, that would be too sweet... At long last, I
could tame the blasphemous sea of cables that slithers malevolently around
my work table... What is this Wizztronics case, btw?

5374. Mono monitor question

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 00:13:56 UTC
From: dwallace@wam.umd.edu
Message-ID: <3co1o4$42r@cville-srv.wam.umd.edu>
Source record: 174644

Well, unfortunately my faithful SC1224 passed away over the weekend, but since I've used it pretty much daily since 1986, I can't complain too much. To get myself back up and running, I found a used monochrome SM124 at a local computer store, and since I don't do a lot that requires color (mostly text + MIDI), and since I didn't want to shell out a lot of money, I'm pretty happy with my decision.

However, I have a couple of questions for other users of mono Ataris. The screen image is quite small; there is at least an inch of black border on all sides of the screen. The color monitors had little dials on the back to adjust this aspect ratio, but I don't see any such thing on this model; does anyone know if there are adjustment knobs to be found inside the case?

Also, a couple of software programs (i.e. Flash) have an option to use 48 line display, which is mighty handy for working with text. However, I'd love to be able to leave this on all the time when writing code and what-not. Are there any utilities which allow this 48-line mode to be used in TOS applications, or even in GEM? I spend a significant amount of time working with a CLI, and this should be easy enough to swing, and it would be even nicer in particular if I could use the smaller type in Word Writer II.

Thanks...

-Steve

5376. Internet Access With Atar

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 01:14:00 UTC
From: Dan.Dreibelbis@balmybeach.tor250.org
Message-ID: <afb_9412150701@tor250.org>
Source record: 174555

here's an important question - can one properly access the
Internet without having to learn oodles and oodles of syntax with
an ST? By this I mean being able to access the Usenet, download
files, leave messages, etc.

I know there's supposed to be a version of MOSAIC (the
Internet click 'n go interface program for the Internet for a number
of platforms) being developed for the ST, but is there any way I
can access this now?

There is the Lynx interface, but it requires MiNT to run, and I
would rather multitask everything utilizing Geneva. It would be
wonderful if there was a BACKTALK script for STalker 3 that would
allow one to have an interface with Internet.

Since GEnie will soon be offering full Internet access, I'd
like to be able to read up on this and access this service properly.
Perhaps this could be a topic for a TAF demonstration (or an
ExtremiST article)?

Any thoughts on this would be wonderful.

... Bill Gates is the Devil - I have proof.....

:>It was announced at a UK Atari show yesterday that CLAb now own the
:>rights to falcon.
:>
:Early 95 will see a Falcon with all the audio fixes called the Clab
:falcon 2. Othr machines are a 68040 and a possible 299GBP machine. They
:are open to suggestions as to how the h/w should develop. Most people
:advised their rep at the show that better graphics would be good.

I would like to see :

- At least a 40mhz 030, (also up the DSP to 40mhz)
- 32 bit CPU memory access/Level 2 cache and FASTRAM.
- 1024x768x256 (A BYTE PER PIXEL MODE IS NEED *SO MUCH*)
- 1024x768x65536
- Replace the jack sockets with LINE IN/OUTS.
- PC Style Case and seperate keyboard(dirt cheap)
- 3.5 " Ide drive(cheap)
- PCI expansion bus.

Other things to consider might be:

- more DSP ram! (a shared CPU/DSP ram segment would be nice, possible?)
- VRAM (high rezs really sllooww the falcon down).
- Speed the Blitter up or design a new one ;-)
- Magic/NVDI OS on Rom ;-)

(I find it hard to enthuse about 40mhz 030's when I'm typing on a PA-RISC :-)
but you can dream....

You may say fortunaley because a sm124 is better than sc1224 to work.

Yes, the SM124 has adjustment knobs inside the case.
There are white et you must turn them just a little.
Be careful because you must turn them when the voltage is ON.

try toad@genie.geis.com

I used that to request a new catalogue.. about 2 months ago. It
took a few days, but eventually I got a Email message back.. a
automated message.... saying that they were too busy filling orders
to respond to all email personally, but if you were requesting a
catalogue, to expect it in a few days via snail mail. Well I don't
know what thier fews days is... but mine ISN'T a couple months! If
you wanted something else, it would be best to call their voice line
(they leave them in this message)..... so its up to you, me? well
I'm still waiting for this "few days" catalogue delivery. :-)

The Wizztronics case is a 19" standard rack mount case for your Falcon which is available NOW from Wizztronics (516-473-2507). It has loads of room for additional boards, hefty 250W power supply, a FAN, detached keyboard and has access to all the ports. It's also a detached keyboard design. I think the cost is about $350 U$D. You'd love it - I saw one at the Conn. Atarifest.
Oops - sorry about that duplicate sentence - online editors suck. ;)

There will be versions of NVDI 3.0 for graphics cards. In fact, the
Matrix version is already available. The ET4000 version will be out
shortly (I'm waiting for that one as well!)

There's about a 10% speed hit when running MagicMac. ie a 33MHz Mac is
slightly slower than a 32MHz TT. However, the graphics might be
faster, etc etc. It certainly *seemed* phenomenally quick running
Papyrus and Speedo 5, and subjectively slightly faster than the TT
next to it.

MagicMac runs as a single System 7 application.

>downloading!! Is there a program (on the PC of course) anyone
>knows of to enable me to format and write to a Atari ST disk??

You can format MS-DOS disks on the atari, and they will be readable both by the PC and ST.
You need to do the formatting on the ST, though, as PC formatted
disks don't always work on the ST. Use a program like KnifeST of Fastcopy PRO
(or one of the PD versions of this program (Fastcopy 3 I think), and choose
MS-DOS format. The disk will format, and should be readable on both the ST
and PC. I've been doing a similar thing, as all my downloading is done on a
PC (I had a small spate with attempting to transfer Mac files, but gave up
in frustration), and this is the way I do it.

Good Luck :)

: --c

The best one I have found is MegaTracker v0.96. It has played everything
I have thrown at it so far.

The file name is Megtkr96.zip and it is available on quite a few FTP
sites in the Falcon directories.

Hope this helps.

Cheers,
Dave

5397. Re: '040 board??? Why not '060 board instead?

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 12:21:06 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <xY-0Wxy.lmcclure@delphi.com>
Source record: 174567

In a message dated 12-13-94, Tommy Jonaeson said:

"No, all 680xx processors have adaptive datawidth. They can
accept any memory size from 8 bit up to 32. (Don't think
060 is 64 bit)"

The 68040 lacks dynamic bus sizing. Motorola later introduced an
external chip to add this function.

You are correct as regards the 68060, it is not a 64-bit chip, but
rather 32-bits. (In fact, unless I am seriously misrembering, the
external data path is 32-bit, not the 64-bit path someone else
reported here).

5398. Flexi-Disk

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 12:40:45 UTC
From: jtace@prometheus.hol.forthnet.gr
Message-ID: <3cpdgd$721@brigitte.forthnet.gr>
Source record: 174568

I 've heard that there is a shareware ramdisk called Flexidisk that works simillar to Neodesk Clipboard. Have any of you seen this tiny ramdisk? or heard anything about it. this ramdisk is reset-proof and takes as much memory as it needs!!!! Like STReview says, Flexdisk : dynamically changes its size when you copy or delete files.

5402. C-Lab Falcon wishlist

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 14:16:26 UTC
From: selick@bu.edu
Message-ID: <3cpj3q$nrq@news.bu.edu>
Source record: 174573

OK, then - here's what I would like to see on the C-Lab Falcon clone:

68040 or 68060 at different speeds for different needs. Preferably at least 50 mhz.

Reasonable room for RAM expansion - in the 128 meg range

Tower Case

Hard drives and RAM should probably be optional, as many people like to make their own config

DSP - if they could come up with a way to throw in Logic Audio, they could build in the dongle into the main board. They do still have the rights to Notator, right? This could be a good selling point.

Go ahead and build in a 486 board as well. Might as well be compatible with those PC's

Include SCSI-2, IDE interfaces

Also maybe have a board with lots of audio in's and out's. Maybe even some XLR's would be nice. 8 rca in's and out's is a start.

Keep the base price down. It's easier to stomach upgrading $300 here and there than $5000 down

Oh - one more thing...ADVERTISE IT!

That's all I can think of at the moment...please feel free to add to this list.

>What? NO Atari Germany? When did they disappear?

Last year or early this year. Normen Kowalewski moved to Atari Sunnyvale,
the phone number still exists (though you are connected to Atari Benelux
in Rotterdam on Atari's cost), but that's all.

I don't believe in a Milan, much more in a Falcon compatible sound board
for the Eagle or Medusa (I'd prefer Eagle). And if there _comes_ a Milan,
THAT part of it should better be compatible to the Falcon, otherwise the
current applications utilizing the DSP would presumably not run :-(.
Is a faster, yet compatible, replacement for the 56001 available?

5404. Gdgets By Small future?

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 15:06:21 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <D0uxyL.HAL@freenet.carleton.ca>
Source record: 174574

Like many other Atari users, I was saddened when I heard that Gadgets by Small had filed for bankruptcy protection. every loss of a developper is a blow to our platforms continued viability. Does anyone know how close Dave really was to releasing Spectre 3.1? Could he see his way to releasing it as shareware or freeware to help out the loyal users of Spectre? Maybe he could license the code to another developper for final tuning. I know I must not be the only one who'd like to run System 7 apps and access HD disks under Spectre.

What about the SST? Is Dave trying to clear out whatever stock he has left? Any info would be appreciated!

Thanks

A recent ST Format mag (November, I think) had an article on using Ataris on the net. I leant my copy to someone, so I'm not sure exactly what it recommended - everything looked pretty straightforward, though.

>Notator, right? This could be a good selling point.

NO! C-Lab do not have the rights to ANY software. They own the 'Notator'
name, that's all. All software belongs to Emagic (Notator SL, Creator SL,
Logic etc). Emagic have a licence to use the 'Notator' name in NSL, but
only that (which is why 'Notator Logic' is now just called 'Logic'.

> I recently had an *infestation* of this virus on various floppy disks I
> had. Does anyone know anything about it?
>
> For example what does it do?

All it does is spread, by itself. It does look for a "key" value on each
disk inserted, and will execute code from that disk if the key matches.
To my knowledge, no nasty key'ed disks have every appears. Thus, this
virus essentially just spreads itself, but could end up doing anything
based on what is on a key disk encountered in the future.

> Does it install onto HD? (I hope it didn't)

I believe the answer is no. It is a floppy bootsector virus only.

Vkiller 3.11 has a blurb in it about the Key (or Signum) virus. Hope that
helps.

"Jealous" is perhaps not the right word. I did not say that English was less suited for international communication than any other language. I simply don't like the fact that some people should have the advantage that their mother language is the "international standard language". The same chances for everyone! (By the way, I am german and not french.)

Best regards

Andreas

From: jwg3@aber.ac.uk
Message-ID: <3cptjk$cj9@fileserv.aber.ac.uk>
Source record: 174585

Hi there,

My brother is interested in getting stuff from the net, he's
got an STE with 1 Mbyte of ram (i think ...) and I have a number
of questions to ask you guy's on his behalf :-

one: what type of modems are you using, can you recomend
one? Do they all come with revelent S/W ?

two: is there a good ftp site for atari software and utilities ?

three : are you linked up to Deamon or the such to get this News
service (being on a SunSparc these trivial matters of how
i actually get the services don't bother me ;))

four : can he get S/W to get mosaic, or is it too slow and a waist
of time?

five : how much is this all going to cost .....

six : what modem protocols do you have to comply to ?

Realy what would be a great help, is a detailed description of
how you're doing it, so I can pass on the info.

Thank you greatly dudes, and please send the stuff (maybe a
modem will find its way into his stocking this chrimbo ....)

John Glazebrook, jwg3@aber.ac.uk

>68040 or 68060 at different speeds for different needs. Preferably at
>least 50 mhz.

For me: 040 (enought power for the price)

>Reasonable room for RAM expansion - in the 128 meg range

Standard SIMM's (70 ns ie. those which go to Wings-card)

>Tower Case

And a 19" rack! In any case: separate keyboard, and room for HDD's!

>Hard drives and RAM should probably be optional, as many people like
>to make their own config

YES!

>DSP - if they could come up with a way to throw in Logic Audio, they could
>build in the dongle into the main board. They do still have the rights to
>Notator, right? This could be a good selling point.

The C-lab and Emagic were splitted due arguments between programmers and
owners a couple of years ago. So AFAIK Emagic own's the rights to
software, and the two companies have nothing in common today.
Dongles change with program levels anyway, so it would not be too smart
to put in a hardware lock for any program. Also what would Steinberg think,
as *they* are the main music soft/hardware suppliers for today's
Falcon? :-)

I'd like to see two DSP's and also that they would be of better quality.

>Go ahead and build in a 486 board as well. Might as well be compatible
>with those PC's

I'd say forget the PC - make a machine that makes you forget Windows
(hey, that should be easy! :-))

>Include SCSI-2, IDE interfaces

Fast SCSI-2 is essential, but IMHO the IDE could be left out.

>Also maybe have a board with lots of audio in's and out's. Maybe even
some XLR's would be nice. 8 rca in's and out's is a start.

I had some information, that there will be digital I/O's.

I'd like to see 2 MIDI in's and 3-5 Out's. Pro-Quality Audio Engine.
Digital converters that can be changed to better ones easily.

>Keep the base price down. It's easier to stomach upgrading $300 here
>and there than $5000 down

If it's delivered without memory and HDD's it should't cost more than
1000 GBP.

>Oh - one more thing...ADVERTISE IT!

The manufacturer is not Atari this time, so the prospects are better!

Graphics: 1024*768 75Hz NI in 2, 16, 256 and 16,7 million colours (such
PC cards are really cheap nowadays, so there are cheap components there).

Continue the list!

```
EM> A friend of mine has an Atari 1040STfm with 1M of memory. He
EM> wants to expand the memory if possible to 2M or more

There are a half a dozen or so modification kits to upgrade the ST
to 2, 2.5 or 4 megs of ram. This will require some delicate
desoldering and soldering. So, its best to have an experienced tech
do the change. If you're calling into Puddle City BBS, look at the
PAC (Portland Atari Club) information and come to a meeting and gets
some valuable hints tricks etc on the best kit to get and possibly a
name or two who'll do the change out.

John

I think this is the ideal time for me to clarify some of the fog
surrounding this deal.

We have not handed Falcon over to C-Lab to do what they want with. They
have signed a license to

a) Buy Falcon from us for sale or OEM use
b) Should we ever stop producing Falcon, they will have the right to
continue that production.

It must be stressed that we have no plans at present to stop producing
Falcon...and of the more they sell the less likely this becomes!

Ms Obersteiner (arm immediately straightens and points to the sky diagonally
on impulse) from this 'ere Euro office has done a superb deal that guarantees
the future of the machine....but it is still our machine.

] I recently had an *infestation* of this virus on various floppy disks I
] had. Does anyone know anything about it?

It copies itself to boot-sectore on floppies. They "key" part of it
won't be found.

] For example what does it do?
] Does it install onto HD? (I hope it didn't)

No.

] said everything was ok. Is there any Virus detectors/killers which
] are ram reisdent and run in the background?

"Guardian" will detect executable boot-sectors, which may help, but
it's a nuisance. The only way is to go through every single disk and
erase all the viruses in the boot-sectors.

Well, the guy at the Atari show who was representing Clab said yes and
that they were the only ones who would produce them in the future.

Atari UK have subsequently said this is untrue and Clab are only
licencing it, not selling it. Who knows?

Either way, they can only do a better job of marketing/developing the
Falcon than Atari ever did.

> Is there any Virus detectors/killers which
>are ram reisdent and run in the background?

Protect6 by Lars Erik Oesterud (sp?) does this. It is a small AUTO folder program which checks boot sectors whenever a new floppy disk is opened. If it finds an executable boot sector, it displays it on the top left of the screen (suspending current applications, I think), and asks if you want to erase the boot sector. If you press `y' (or if there is no executable boot sector), Protect6 will erase the boot sector and make it MS-DOS bootable, installing its own info there so it can recognize disks it has protected.

It will also notify you when a program (file extension PRG, ACC, TOS, etc) is going to be modified, and gives you a chance to reboot, thereby protecting yourself from link viruses.

It is available just about everywhere online, and the small shareware fee (~$10US) is well worth it.

>finder? If so wouldn't it be slower than a Medusa T40 (or even T60 for
>that fact).

From what I've seen and heard MagiCMac runs as a parallel application. But the
Medusa still have the slow atari-bus to squeeze all the data through.
Especially vertical scrolling is so s-l-o-w, you won't believe it.

> Also I realise that Mac's are cheaper than a Medusa, the T40
>retails for 3,400 U$D. However what about speed? I.e. an equivalent Mac040
>would it be faster or slower than the Medusa?

MacMagic is not an emulator. It's a complete OS running on the cpu it was
designed for. A MAC Performa 630 is about three times faster than a TT.

I'd _guess_ a Mac running MagiCMac is still faster than a T40 with the same
clock-rate. Dunno about the T60, but this is yet another price-step to heaven,
isn't it?.

And in addition you have a decent Mac as well. One shouldn't forget that.

I wish I had an English version of the MagiCMac-FAQ. Lots of stuff answered
there. Perhaps SystemSolution are doing one?

I have something translated for you guys out in netland, though.
The list of tested programmes as of December 10, 1994:

Completely MagiCMac compatible (A-Z)

ASH-Utilities
CAT, Calamus SL (Summer 1994), Connect
Ease 3.5, Everest
Fred
Kobold
LHARC
McCoy, Megamax Modula 2, Morpher 1.0
Papyrus, Papillon 2.2, Phoenix 3.5, Postfix 1.1, Pure C (Debugger needs an
040-patch)
QED
Script 2, Signum!Drei, ST Online 4.1 (Datex J), ST-ZIP

Tempus Word (fixed version), Twist, Twilight (fixed version)
XControl (some CPX-modules work, others don't)
WinCom

Compatible, slight limitations

Signum!Zwei (640x400 monochrom, printing with PREMUL and printer-file
1st BASE (problems in accessory-mode, will be fixed)
DA Layout (single-mode), DA Picture
Gemini
Harlekin
Karma, Kandinsky, Kodak-Photo-CD-Software
XEdit

Not yet working

DA Vektor (eine ï¿½ltere Version funktionierte, ist also nur eine Kleinigkeit)
Omikron Basic
GfA-Basic (as some programmes compiled with it)
Pure Pascal (will be fixed)
Pure Profiler (requires MFP-Timer A)

Bye!

5440. MiNT Problems (Part 1)

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 20:33:17 UTC
From: bdean@hpb.hwc.ca
Message-ID: <3cq96d$q2m@m.ehd.hwc.ca>
Source record: 174503

I'm using a 4 meg STe with TOS 1.06, MiNT 1.12 via the Toswin (V1.4) accessory. I also have a Minix file system (.60 PL10) mounted on one HD partition and use TCSH, I beleive it's v6.02.

Depending on what AUTO folder programs I load, (as selected by Superboot 8.1,) MiNT may or may not load it's configuration file from C:\.

For example; if I run GEMRAM(1.6)/WINX(2.2) before MiNT, my environment variables, as defined in the MINT.CNF, are not put into the environment space.

Is there a known incompatability between MiNT and TOS 1.06? ..or GEMRAM/WINX? ..or Superboot?

Has anyone else had this happen to them and how did you remedy the problems?

>>mhz.

Different speeds makes good sense, and shouldn't be avoided just because that's what other companies do. Upgradeable mother boards would be handy, then no need to buy a whole new computer, and less expensive too!

>>Reasonable room for RAM expansion - in the 128 meg range
>Can anyone afford that much RAM...?

Well if the "new" Falcon's graphics and sound were up to it, then people would need 128 Meg (or more) for ram-intensive sound and graphics apps.

I don't think 8 RCAs would be neccessary though - how about having just 2 in / 2 out from scratch and allow customers to order any extras from an option list?

I agree it's better to pay less from the start and pay for upgrades. I wonder how many people used things like the LAN port on a Falcon and I wonder how many people actually used MIDI ports?

Perhaps these could be an option to keep the initial price down also?

Richard =8-]

PS. I think that the initial comment about advertising is _VERY_ _CORRECT_

Sorry, but you're wrong.

The 68040 board started as a design project in the (now gone) German
ST-Magazin!

Now it's in Fredi's hands, that's correct.

>The PAK68/3 accelerator was a project from the German magazine "c't".

Right.

5444. MO Fujitsu 230Mb on atari TT?

Newsgroup: comp.sys.atari.st
Date: 1994-12-15 20:40:32 UTC
From: ybernard@innet.be
Message-ID: <ybernard-151294214642@ybernard.innet.be>
Source record: 174538

Hello All,

this is for a friend of I:

he owns a magneto-optical drive from Fujitsu, a 230Mb, scsi and wants to
use it on his atari TT; no way; it does not seem to be recognized.

Any of you has an idea?

Please reply by e-mail as i don't read very much the news...

Thanks a lot

IMHO it would be the best to leave C-lab doing their own thing. After all
they are trying to do a machine that the people want. I have always had
the impression that Atari could not care less of what the users need.

Their (Atari's) 040 is probably the same as 030 with all the former
mistakes (like 16-bit bus, miniplugs, low quality AD/DA's...)
Why should they do any better now?

: please mail me.

Why would you want 512K SIMMs?? If all you want is 2 meg of RAM, just
put in two 1 meg SIMMs. You could even fill the machine out using two of
the displaced 256K SIMMs.

I didn't know there were 512K SIMMs.

: of questions to ask you guy's on his behalf :-

: one: what type of modems are you using, can you recomend
: one? Do they all come with revelent S/W ?

Any standard external modem will do, preferably the fastest you can get. A brand name 14,400 baud fax/modem is going for about $175 Canadian locally, cheaper if bought used. He will need a standard serial cable to hook it up to his Atari. Most 'in the box' software is for the PC or the MAC & is pretty much useless to us. I'm not going to start another flame fest so I'll just say that there is a number of very good comm programs, in commercial, shareware and public domain flavours.

: two: is there a good ftp site for atari software and utilities ?

atari.archive.umich.edu and its mirror sites.
micros.hensa.ac.uk

There are many others, I think you just missed the list. It is posted here about once a month or so, so stick around, you'll see it.

: four : can he get S/W to get mosaic, or is it too slow and a waist
: of time?

I think to use it he would have to have a TT or Falcon. There are SLIP, UUCP and PPP packages for the Atari, but I don't know much about them.

: five : how much is this all going to cost .....

Pretty much depends on how much you are willing to put out.

: to continue writing a EuroNews style column for it the commercial
: feasability of such a newcomer at this point in time is very questionable.

A few years ago I was involved in trying to set up a new 8-bit mag,
it was based around the idea of quality (tech stuf) AND games. We tried
everything. Free software, cheap games and a LOW subscription price but
it still didn't get anywhere. I know the 8-bit market is small but I
fear the ST in the long term will go the same way.

I would suggest one thing though offer poeple a ST Apps (I haven't seen
it but I gather it is a bit serious) and ST Format mix and you might
be on to a winner. It is very cheap to print the mags typically less than
#2 (in B&W) but the real costs are running it, e.g edd, journalists,
admin etc. If people accepted a minimal amount at the outset you might get
somewhere.

I'm game if you are?

The *data* ones. Don't know what the audio ones cost.

> BIG difference! I wouldn't rely on an audio-DAT to backup my data.

Well I've seen suposedly reputably companies supplying patches to mini
computer applications on *audio* DAT types. They worked - but thats all
I can say for them. The company I work for only buys *data* ones.

Roland.

>are supposed to do the GUI-stuff, it uses its own (AFAIK). Therefore,
>MS Word is (e.g.) surprisingly slow on a PowerMac or on S 7.5 since
>it cannot take advantage of the optimized OS routines.

Word isn't an application, it's a P-Code interpreter with a whole lot of
P-Code sitting there. _That's_ why it's so huge, and so slow on
anything... the running program is actually interpreted P-Code instead
of compiled machine code. Interpreted languages are almost always much
slower than compiled languages.

What does this have to do with comp.sys.atari.st or even the "Obsolete
Ataris" thread? It should be in alt.fan.bill-gates under an "idiotic
p-code" thread.

Check out http://www.ibm.com/ for a good article analyzing the Pentium's division problems... For an "average" user of a spreadsheet (ie, not heavy scientific or ray-tracing applications), they'll get a totally undetected math error about once every 24 days. And that's counting only ~15 minutes/day of actual calculations (ie, most users sit around a lot, or enter data, or whatever, and only do a re-calc every now and then).

5459. 1994 Jaguar Letter Writing Campaign (repost)

Newsgroup: comp.sys.atari.st
Date: 1994-12-16 04:02:37 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3cr3gu$g2s@usenet.INS.CWRU.Edu>
Source record: 174530
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy,alt.games.lynx

I'm reposting this again because it is important for everyone to write these companies this month. I have posted it today for you to print out and then do some writing this weekend (with those extra .29 cent stamps you have left over from Christmas cards!).

And remember, this is the best time to write. Stamps only cost .29 cents. Find those left over stamps and write!

I will not post this the week of Christmas so please copy this text now!!!

-------- begin text --------

END OF THE YEAR Jaguar Letter Writing Campaign

Organized by: Len Stys

E-mail: aa399@cleveland.freenet.edu

Hey Jaguar players!

In September, I spent several hours getting names, addresses, and information related to these well-known game software companies for you. I did this because I felt it was real important for everyone to write these companies and let them know that we want their games for the Jaguar. Since September, I have been posting four or five of these companies each month to the Internet and various systems to get the word out about this campaign.

If you haven't written them because you didn't have time, this is your last chance this year to write them.

It is extremely important for these companies to start developing for the Jaguar now. This is because December is really the last month that developers can start developing for the Jaguar and have their game out for it by Christmas of next year. It takes approximately nine months to develop and manufacture a real great Jaguar game. And add another couple of months if the programmers need to get familiar with the unit.

If you are worried that Sony, Nintendo, and Sega are going to come along late next year with a $70 million advertising budget to spoil the Jaguar's fun--you should be worried! Because that is what the companies are planning to do. (Let's not forget about 3DO and Apple Computer!)

Right now, Sony, Nintendo, and Sega are attempting to convince these very companies listed in this text-file to develop for their next generation system. Atari Corp. is probably doing the same thing. But Sony, Nintendo, and Sega are bigger players than Atari right now. This is why we need to help Atari

out a little bit by letting these companies know that we want their games for the Jaguar.

I cannot urge you enough to write these companies. You (even though you may not realize it) play a big part in if the Jaguar succeeds or fails. Just by -one- letter to each of these companies could determine Jaguar's fate. Your one letter can also make sure your investment in purchasing the Jaguar and several Jaguar games was a wise one.

Christmas time is about GIVING to others. Why not give Jaguar a chance in 1995? Write these companies.

id Software
WMS Industries Inc.
Capcom USA Inc.
Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing Wolfenstein 3-D and DOOM for the Jaguar and encourage the company to make QUAKE for the Jaguar.

id Software's e-mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The following is a list of things which you may want to say in your letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D and/or DOOM.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D and DOOM for the Jaguar.
4) How you are excited about id Software making games for the Jaguar.
5) How you would like to see QUAKE made for the Jaguar.
6) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning Jaguar DOOM II. It is possible for id Software to release DOOM II for Jaguar next year. If you would like to see DOOM II for the Jaguar, encourage the company to make it. But if you do encourage them to make it, ask that it support modem and at least four players networked. Also, ask for the company to place DOOM II on cartridge so that public domain maps can be released on CD for Jaguar's CD-ROM player. This will make sure that DOOM II -never- gets boring on the Jaguar and multi-playing is always exciting.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of December 1, 1994, Mortal Kombat II has not been announced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, WMS Industries will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let WMS Industries know that we want to see Mortal Kombat II and Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the Jaguar will be the most wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and as professional as possible to get the best results. If you certify your letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) How you would also like to see Jaguar be the first system to get Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But

Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management

just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485
Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.
6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar. I love this game and it would be great to see a modem feature being used in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game company makes many wonderful titles for the PC such as: Betrayal at Kronder, Aces of the Pacific, and Front Page Sports Football Pro. The company is planning to release: Front Page Baseball, Battledrome, LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.
P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Dynamix games--I'm choosing Front Page Sports Football, Alien Legacy, and Aces of the Deep).
5) How you believe Dynamix games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And if there is any truth to the rumor of a new Indiana Jones movie, LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CAIN Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to thank the company and to encourage them to make more titles for the Jaguar. Virgin is suppose to be making Cannon Fodder, Demolition Man, and Dragon for the Jaguar. The company is also planning to make a CD-ROM game called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called: The 7th Guest. It has also made Land of Lore, Dune II, and Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest (and name a few) besides the ones the company is already making for the Jaguar.
6) How you would like to see the Jaguar modem and network features used in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game. The game can even be played through the modem on PCs. Spectrum Holobyte has just released Fields of Glory and is rumored to be working on Falcon 4.0.

Modem games is something that a game system must have if it will be successful in the future. And Spectrum Holobyte is well-known for their modem games. Falcon 4.0 sounds like it would be perfect for the Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number: 510/522-2138. But please keep in mind that sending a letter through the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis' popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of Pysgnosis games).

5) How you believe Psygnosis games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced for the Jaguar.
7) Thank the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games. The company is owned by Electronic Arts but may have freedom to develop for any system it wishes. Some of the games that Origin makes are: Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer, and just recently Pacific Strike. Origin will be also making Biforge and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750
Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

QQP, Inc.
Broderbund
Konami
MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some pretty amazing games for the PC. Some of the games are: Solitaire's Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war. Strategy games are always popular, but war games have been restricted to PCs due to lack of a "save game" feature on video game systems. Jaguar can save games on its cartridges so this is no longer a problem in getting war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.
Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles Tournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if you have already sent mail to the company.

****

The Suburban Chicago ATarians (SCAT) user group will hold its December meeting/Christmas party on Tues. Dec. 20 at 7:30 PM at the College of DuPage, Room SRC 1046 (at the North end of the cafeteria, which is at 22nd St. and Lambert Rd., in Glen Ellyn). We will have our Elections and our annual Charity Benefit Auction, and generally just munch on goodies and have a good time. (There will probably be a Jaguar set up, so if you haven't seen one of these, you just gotta come!)

Everyone is welcome to attend. (Especially anyone who is thinking of joining SCAT :-) Remember, SCAT memberships are FAMILY memberships, so feel free to bring your family.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

That alone requires a 4 meg VRAm Video card. That's about $300 - $500
depending on the quality... I'd say stick to 2megs. Sure, you can "only"
get 800 x 600 in 24bit color, but you can do 10 x 7 in 16 bit color. It's
good enough for 99% of applications. Hell, they can even do just a 1 meg
of Vram abilities...

^^^^^^^^^^^^^^^^^^^^

As long as you like interlacing and/or lower refresh rates. As I recall,
the crucial thing is that the system can give the video controller
something like 24 MB/s of total bandwidth, no more. You also get a system
slowdown at higher resolutions: the memory bus is contested more by the
video controller in high bandwidth modes.

Any cheap (under $150) SVGA card worth its salt should be able to handle
1024x768x256 at 60 Hz noninterlaced or better, a resolution which the
Falcon is incapable of even with the ~$100 hardware res-enhancers.

> external data path is 32-bit, not the 64-bit path someone else
> reported here).

The spec sheet I got from Motorola at COMDEX lo, those many years ago, at least according to my memory, claimed a bus width of 64 bits. It makes sense, since the 68060 is a superscalar processor, and thus will need a much higher bandwidth than a single-issue processor.

: You could also use CoMa which should be available on different ftp-servers.
: It's cripple-ware - you could only send 500 lines but you could receive
: a fax without problems. It costs about 100,- DM to get the key. (It also
: supports voice modems and allows the user to run a small ftp-server.)
^^^^^^^^^^^^^^^^^^^^
SNIP!

Hmm, does anyone know if this will work with the new Supra 28.8k modems
that have the voice port in the back? Thanks

Hi folx!

This is what you've been all waitung for (at least I think you were :-):

I'm not the author of this FAQ. Please reply to the given CI$-address!

---------------------------electronictearline-------------------------------

MagiCMac: Frequently asked questions Date: 12. Dec 1994
==
You find an updated version of the FAQ list (MMACEFAQ.TXT) in the
public section of the ASH mailbox. (Phone 0049-6221-303671/German user
interface, sorry)

Further questions and other information can be posted to the ASH
CompuServe account 100067.3712@COMPUSERVE.COM

Contents

General
Printing
File system and data exchange
Hardware
The Mac side
Application compatibility
List of tested Macs

General

Q: What is MagiCMac?
A: MagiC is a preemptive multitasking operating system which was first
developed for computers of the Atari-ST- and TT-series. It there became
very widespread. It is highly compatible with most of the Atari software
packages. MagiCMac is MagiC for Apple Macintosh computers.

Q: Does MagiCMac include any hardware?
A: No. MagiCMac is a pure software package.

Q: Is it very difficult to install MagiCMac?
A: No, not at all. MagiCMac comes on only one disk. After you have inserted
the disk just double click the setup icon and the program does the rest.

Q: Which computers work with MagiCMac?
A: MagiCMac works with all Apple Macintosh computers with a 68030 or 68040
processor. For example, Quadra 700, PowerBook 150, Duo 270c, Performa 475
or 630. You should have at least 4 MB RAM available. With this
configuration you will only have 1.5 MB under MagiCMac. For convenient

working we recommend 8 MB RAM.

Q: Does MagiCMac work with Apple's PowerMacs?
A: No, not with the version currently distributed. MagiCMac also does not run under the 68K-emulation of the PowerMac. As the 68K-emulation only emulates a 68020 processor without a PMMU and the PMMU is absolutely necessary to run MagiCMac. But, we are planning a special version for the PPC.

Q: Which software packages can be used under MagiCMac?
A: Generally speaking, it is very likely that any application which ran under MagiC on the Atari (and does not have any specific hardware accesses) will run under MagiCMac. For example, Signum!Drei, Papillon and Phoenix. A file (MMAC_PRG.TXT) listing all the software packages that work with MagiCMac can be downloaded from the public section of the ASH box.

Q: How much RAM can be used under MagiCMac?
A: MagiCMac itself has no limitation. The problem is that the Atari's I/O section lies at end of the 16-MB-range and this RAM section must not be overlapped by any application. But, this does not mean MagiCMac cannot be used with computers that are equipped with more than 16 MB RAM. For example, if your Macintosh has 48 MB RAM the upper 32 MB or the lower 16 MB can be used. This will be subject of changes in future versions of MagiCMac. So that in the end the whole memory can be used. There will be a division as on the Atari TT into ST- and TT-RAM .

Q: Is the emulation fast enough for my software?
A: MagiCMac is not an emulation. MagiCMac runs on exactly the type of processor it has been designed for. That is the reason why on the Performa 630 software runs four times faster compared to TT-speed. If you consider that most of the TOS applications can be very well used with a 68000/ 8 MHz processor, imagine what will happen if you run them with an 68040/ 33 MHz.

Q: Which monitor settings work with MagiCMac?
A: All known Macintosh resolutions are supported. The standard version supports 256 colours. With an additional driver 32.768 or even million colours can be displayed. In the 640x400 mode MagiCMac can be run in a mode which is different from the current Mac setting.

Q: Which desktop is used under MagiCMac?
A: The MagiCMac package includes Ease, a graphic user interface. The final version of MagiCMac (Version 1.0) will come with a modified version of Ease which will allow to eject disks with a newly built in function.

Q: What about the second mouse button?
A: Usually a Mac mouse has only one button. The second button can be simulated by simultaneously pressing the Cmd-key and the mouse-button. There are two-button-mice from third party suppliers which can be used with later versions of MagiCMac.

Q: What about the function keys, the help key ...(e.g. PowerBooks)?
A: Several keys, e.g. Help, Undo and function keys are simulated by pressing the Cmd-Key plus the respective other key. E. g., function key F1 is simulated by Cmd-1.

Q: How can I eject floppy disks?
A: In this version of MagiCMac you have to switch to the Apple menu (Cmd-W) on which you will find EJECT. You can also press Cmd-Shift-1 to eject a floppy disk.

Q: How much does MagiCMac cost?
A: 298,-- DM. Users who already have MagiC for the Atari pay only 250,-- DM.

Q: Where can I get MagiCMac?
A: Directly from Application Systems Heidelberg, PO box 102646, D-69016 Heidelberg, Phone 49-6221-300002, Fax 49-6221-300389 or any software dealer. In the UK the distribution is done by System Solutions, Brandt Fernandes Ltd., 17-19 Blackwater Street, London SE22 8RS, Fax 44-1816936948.

Q: Is MagiCMac already available?
A: At the moment ASH is shipping a preliminary version which is already very robust. An update to version 1.0 is already included. It will be shipped free of charge as soon as it is ready.

Q: Is there a demo version of MagiCMac available?
A: Yes, there is a demo version. Slightly modified it does allow printing or accessing external SCSI harddisks. You can test compatibility of your applications. The demo can be found in the ASH box and is updated from time to time. Currently it is all German.

Printing

Q: Can every application print from MagiCMac?
A: Every application that uses BIOS for printing can also print from MagiCMac. If an application directly uses the Atari hardware printing is not possible.

Q: Can I use my Centronics printer with MagiCMac?
A: Yes. There are several options. The Macintosh is equipped with a fast serial interface which is able to send data at a speed of 56 kilobaud. You can connect the printer and your Mac via serial port by a cable with integrated serial/parallel converter. The cable transforms the serial signal to a parallel one which is compatible with Centronics and therefore data can be sent at full speed to the printer. This procedure is faster than the direct use of the printer's built-in serial port because most of the printers only reach a speed of 19.200 baud. A cable like that costs about 100,-- DM. Another option which we consider more reasonable, is to use the software package Powerprint. This package includes more than 1.000 drivers for DOS printers and of course the cable mentioned above. It costs 250,-- DM and is available through Application Systems. The advantage with PowerPrint is that you are able to print also from Mac applications.

Q: Can I use an AppleTalk printer which only understands Quickdraw?
A: No, not with the current version of MagiCMac. The reason is simple. As nobody has been able to connect a special Apple printer with an Atari computer there is no application that includes a driver for this purpose. But we think it will be only a matter of time until drivers will be available.

File system and data exchange

Q: How are files stored under MagiCMac?
A: Files are stored as usual on your Mac harddisk. We recommend to create a subdirectory and assign it in the MagiCMac parameters for example as drive 'C:`. You can very easily exchange data with Mac applications. For example, scan a picture using a Mac application, store the file in the folder you chose as Drive C: and switch to MagiCMac. Now you can open the file in Papillon and edit it. Also there is the possibility to use cut, copy and paste from the MagiCMac clipboard to the Mac clipboard and the other way round. This does work for text only at the moment.

Q: How can I use my Atari data on the Mac?
A: Together with Apple's new system software comes the utility PC Exchange. Using it the Mac can read PC-formatted disks which can also be read by the Atari. If you are not sure whether the disk is PC-formatted or not you should format it on your Mac (Format: DOS 1.4 MB or Format: DOS 720 KB). If you insert a DOS disk without having PC Exchange installed your Mac will ask you if you would like to have the disk formatted. If you insert a disk under an active MagiCMac you can can read it. Because PC Exchange is not necessary to read a DOS disk once MagiCMac has taken control over the disk drive. Problems with reading a disk may occur with 720 KB disks that were formatted under an older TOS and also with exotic formats (e.g. 10 sectors, more than 80 tracks). In those cases the data has to be copied onto a PC formatted disk. Most of the software packages are distributed on PC compatible disks. For example, Signum!Drei can be installed directly from the original disks.

Q: What about SCSI devices?
A: SCSI harddisks can be connected directly to the SCSI-interface of the Mac. If the harddisk is formatted in a AHDI-compatible mode it cannot be addressed by the Mac. But MagiCMac detects the device and assigns it to the next free drive. You can instantly use the harddisk under MagiCMac without any further adjustment.

Q: Am I able to make a network access?
A: A computer that is connected via AppleTalk appears as a directory under MagiCMac and can easily be assigned to a partition. Another computer can be addressed as drive G: from MagiCMac or any application running under MagiCMac.

Q: And what about filesharing?
A: At the moment filesharing is not possible because the system calls are not implemented. Filesharing may be implemented in future versions.

Q: Can I use a CD-ROM drive?
A: Yes, you can. Under MagiCMac the CD-ROM drive is a subdirectory. You only have to assign it to a drive and access it as usual.

Q: Can I use an external SCSI-CD-ROM drive in a chain with an Atari harddisk?
A: Yes, devices like that can addressed from the Mac and MagiCMac without any special adjustment (of course, you need a CD-ROM driver for the Mac).

Q: Do I have to install a special driver software for MagiCMac to use
CD-ROMs?
A: No. You can read CD-ROMs directly using the Mac operating system and its
drivers.

Q: What about ARA?
A: ARA stands for Apple Remote Access and is used to contact another Mac via
modem and access its harddisk. You can use ARA under MagiCMac. The remote
Mac can be connected via ARA and appears as a directory. You just have to
assign it to a drive and you have full access.

Hardware

Q: What kinds of monitors work with a Mac?
A: You can connect any VGA monitor to the Mac. You just need a special
connector for about 50,-- DM.

Q: What about the DMA interface and the ROM port?
A: Macintosh computers are not equipped with a DMA interface or a ROM port.
Therefore you cannot use an application which needs the DMA interface or
ROM port for a protection key (dongle). The Atari laser printer cannot be
used with the Mac. Several companies intend to develop a card for the Mac
which will allow DMA and Midi.

Q: What about Midi?
A: The midi interface is optional. At the moment it is not supported
by MagiCMac.

Q: Is there a two-button mouse for the Mac available?
A: Yes, there is. MagiCMac will support at least one type of
two-button mouse.

The Mac side

Q: Do I need any extensions or control panels?
A: No. MagiCMac is 100% clean. No additional files - neither system files nor
control panels - are needed

Q: What does MacOS do when MagiCMac is active?
A: For MacOS MagiCMac is just another application. MagiCMac runs parallel with
the Finder or any active application. You can switch from MagiCMac to
another application and back at any time.

Q: Can I exchange data via clipboard?
A: With the current version you can cut pieces of text from MagiCMac
applications and paste them into Mac applications and vice versa.

Q: Which Version of MacOS do I need to run MagiCMac?
A: MagiCMac runs under System 7.x (also 7.5).

Q: Can I use the Mac's virtual memory?
A: Virtual memory can be active. But MagiCMac can only address the built-in
memory. Anyway, when switching from MagiCMac to Mac or vice versa parts of
the applications running may be moved into virtual memory.

Q: Can I use RAM Doubler?
A: RAM Doubler is a very efficient memory administration and can be used on the Mac side. But as mentioned before MagiCMac is only able to address physical (built-in) memory

Q: Is MagiCMac already able to use the FPU?
A: Yes, if the FPU is a real coprocessor 68881 or 68882. Soft-FPU does not work with MagiCMac. The integrated FPU of the 68040 cannot be used with the current version of MagiCMac.

Application compatibility

Q: Does NVDI run under MagiCMac?
A: NVDI has to be adjusted to MagiCMac then it will run under MagiCMac.

Q: Which fonts will be supported?
A: All the fonts that NVDI supported on the Atari, including TrueType fonts. Postscript is currently not supported. A special MagiCMac version of NVDI will allow to use those TrueType which are already installed under MacOS.

Q: Does Gemini run with MagiCMac?
A: Simple Answer. Gemini runs under MagiCMac.

Q: Does Signum!2 run with MagiCMac?
A: This is the question we hear more frequently than any other. And much to everybody's surprise the answer is : Yes, it does run. Because under MagiCMac there is a special 640x400 monochrome mode which allows to run even older applications. If you want to print from Signum!2 you have to redirect the output to a file (with the tool PREMUL) which you later drag onto the printer.

Q: Can I use Kobold under MagiCMac?
A: You can use Kobold in the fast Kobold-mode with an external AHDI-formatted harddisks (e.g. SCSI harddisks). You can also use it on the Mac's drive but just in the GEMDOS mode. You can also use applications like Semprini (harddisk optimizer) or disk monitors.

Q: Does Calamus run under MagiCMac?
A: Yes, it does. And the speed is astonishing.

Q: Can MagiCMac handle long file names?
A: Yes, it can. To display it on the MagiCMac desktop they are cut to 12 letters. MagiCMac has a modified file system which allows extended file names.

The following Macintosh computers have been tested with MagiCMac:

Apple Workgroup Server 95
Quadra 950, 700, 840
Performa 475, 460, 630
PowerBook 145B, 150, 210, 270C, 280C
Mac II fx

Compatibility under MagiCMac. As of: 15. December 94
==========

Fully working programmes (A-Z)

ASH-Utilities
CAT, Calamus SL (Sommer 1994), Connect
Ease 3.5, Everest
Fred
Kobold
LHARC
McCoy, Megamax Modula 2, Morpher 1.0
Papyrus, Papillon 2.2, Phoenix 3.5, Postfix 1.1, Pure C (Debugger has some
problmes on 040-Macs, will be fixed with a patch)
QED
Script 2, Signum!Drei, ST Online 4.1 (Datex J), ST-ZIP
Tempus Word (angepaï¿½te Version), Twist, Twilight (fixed version)
XControl (some CPX-modules work, others don't)
WinCom

Fully working, slight limitations

Signum!Zwei (640x400 monochrome, printing with PREMUL and printerfile).

Tested (no problems)

1st BASE (some problems in ACC-mode, will be fixed)
DA Layout (single-mode), DA Picture, DA Vektor (2.1)
Gemini
Harlekin
Karma, Kandinsky, Kodak-Photo-CD-Software
XEdit

Not yet working

Omikron Basic
GfA-Basic (and many programes compiled with it)
Pure Pascal (will be fixed)
Pure Profiler (doesn't work, requires MFP-Timer A)

:>keyboards. Problem is, I use a PC at work to do all my
:>downloading!! Is there a program (on the PC of course) anyone
:>knows of to enable me to format and write to a Atari ST disk??

:You can format MS-DOS disks on the atari, and they will be readable both by the PC and ST.
You need to do the formatting on the ST, though, as PC formatted
:disks don't always work on the ST. Use a program like KnifeST of Fastcopy PRO
:(or one of the PD versions of this program (Fastcopy 3 I think), and choose
:MS-DOS format. The disk will format, and should be readable on both the ST
:and PC. I've been doing a similar thing, as all my downloading is done on a
:PC (I had a small spate with attempting to transfer Mac files, but gave up
:in frustration), and this is the way I do it.

Later TOS versions (STe upwards?) will format MSDOS format as standard.

: The best one I have found is MegaTracker v0.96. It has played everything
: I have thrown at it so far.

: The file name is Megtkr96.zip and it is available on quite a few FTP
: sites in the Falcon directories.

: Hope this helps.

: Cheers,
: Dave
: --

I know there is a player for the Falcon, But is there a converter/player
for the 1040STe, So I can convert s3m files to 8-channel Fast-tracker
Mods that are compatible with OctalyserSTe, Hopefully the makers of
OctaSTe will support the new s3m format. Since it seems to be outgaining
the Fast-Tracker format 10fold.

The www browser for the Atari is a lynx port. (lynx 2.3?.?)
It is a text only browser -> no GEM.

It's working fine on my machine for several weeks now. I'm using lynx
together with MiNT an MiNT-NET 0.56.

I would also be nice if the DSP DMA channel between the DSP and the rest of the system gets wider like 32-bit or something like that for fast access to system memory.

And something VERY important - THE MACHINE MUST BE WITH OPEN ARCHITECTURE SO THAT IT HAS LOTS OF EXPANSION POSSIBILITIES. A PCI-BUS WOULD BE VERY GOOD.

Keep Cool and Flying...

ChainXOR....

Thank you for your interest in Rainbow, Dave. I`m glad you liked it.
Unfortunately we have no US/Canadian distributor, but if you can
recommend any Atari dealer in Canada I would very much appreciate if you
could give me the address (preferably as a public message in this area,
or an E-mail to f90rusa@dd.chalmers.se which will be forwarded to me).
I'm not sure what the price will be in Canada, but I'll look into that.
Brushes and a whole lot of other things will appear in Rainbow II
Multimedia.

Best Regards Mandus Soderberg, Addiction Software

It's also poor netiquette to hold discussions over seven newsgroups simultaneously. There's been probably more bandwidth used up by the resulting argument than by the original files.

Andy.

The new Falcon(?) should be using a PowerPC chip not the 680x0 one.

When using Calamus 1.09 under MagiC, I have a problem of not being able to move any sort of frame to a new position. Does anyone know how to fix this problem. With Calamus SL, I have found that i cannot enter any text inside the text editor under MagiC as well, anybody else been able to overcome this problem to? Or is Calamus totally incompatible with MagiC?????

Source record: 174535

Steven Selick (selick@bu.edu) comp.sys.atari.st wrote:
: OK, then - here's what I would like to see on the C-Lab Falcon clone:

: 68040 or 68060 at different speeds for different needs. Preferably at least 50
: mhz.

68040, with upgradable processors using ziff sockets!!!!

: Reasonable room for RAM expansion - in the 128 meg range

Maximum needed is 8 SIM slots which could tak 8*4meg simms which
is more than enough.

: Tower Case

Yeah! GOOD call, with a turbo button to slow it down for ST stuff...

: Hard drives and RAM should probably be optional, as many people like to make
: their own config

Should make it IDE/SCSI so you can get cheap P.C drives...

: DSP - if they could come up with a way to throw in Logic Audio, they could
: build in the dongle into the main board. They do still have the rights to
: Notator, right? This could be a good selling point.

: Go ahead and build in a 486 board as well. Might as well be compatible with
: those PC's

No need if they make it better, who would bother with the P.C bit???
Otherwise you'll end up with somthing simular to that amstrad P.C with
the mega drive in it...

: Include SCSI-2, IDE interfaces

: Also maybe have a board with lots of audio in's and out's. Maybe even some
: XLR's would be nice. 8 rca in's and out's is a start.

: Keep the base price down. It's easier to stomach upgrading $300 here and there
: than $5000 down

If it is fully P.C compatible, I mean in the hardware department then
the price could be kept down as you could add stuff as you wanted...
E.G
P.C Dual Speed C.D Drives
2.8 Meg Floppy Drives
Bigger IDE or SCSI Hard drives
New Keyboards, as these should be external and sam sockets as P.C ones

: Oh - one more thing...ADVERTISE IT!

: That's all I can think of at the moment...please feel free to add to this
: list.

> in releasing the machine. Whats your opinion, could C-Lab try but buy
> the rights, complete this machine and released it?
> That would be a nice idea, wouldn't it?

It would =-) !

But there are some things worth considering, though...

First, F-030 was _so_ incomplete when taken to production that nobody would want to have another "incomplete" Falcon model out, no matter 030 or 040? Fortunately, the design flaws in F-030 are mostly pretty minor; loudness in sound output (easily fixed), the casing (again, easily changed..), the keyboard, etc...

Then I've heard that TOS 4 isn't completely 040-compatible (why?) without fixes.

This all means that although there very probably _is_ a 040 Falcon existing, and perhaps even working, there's pretty lot to do before it's really working and ready for commercial manufacturing.

I personally wouldn't be too surprised, if Atari (despite their current product policy) released some updated Falcon model in silence. If they have one relatively ready, that is. They wouldn't put much money behind it - but they do have a music computer business to think about...

And if I were in Atari's shoes, I wouldn't want to lose this music market. It's that simple. Falcon 030 is a nice computer despite its problems, but today you need a bit more horsepower, different casing, etc. to really compete against Mac and PCs. Atari probably waits for its moment.

Just think: WHY do they still produce TTs and F-030s..? For hobby? No. There are reasons behind that - and one reason is that Atari doesn't want to give up computer business completely. Righ now they have to; there's barely enough money for Jaguar alone.. But if/when Jaguar gets on its wings (well, symbolically..), then... We'll see.

5484. Re: '040 board??? Why not '060 board instead?

Newsgroup: comp.sys.atari.st
Date: 1994-12-16 15:13:34 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <3csaqu$4tb@josie.abo.fi>
Source record: 174540

This goes a bit aside from the actual subject, but anyway:

A silly, simply question:

HOW does one change Falcon 030's bus speed from 16 to 18 or 20 MHz..?

Would a simple change of the oscillator be enough (like in many PCs) ?

If not, why?

While we're all dreaming of 040/060, we could spend the waiting time blowing
our Falcons up with a bit faster 030 CPUs ;-) ?

I believe Falcon can be modified more or less "do it yourself" - I have removed
the loudness circuit for example, with good success. Now the freq. response is
linear (inside 1 decibel) between about 40 and 18000 hz. That's good enough
for anyone. But those "speed" things are a bit more bizarre - there doesn't
seem to be lots of information around. Those who "know" seem to keep their
knowledge - and produce their own Falcon accelerators for sale ;-) !

That's good - but it would be interesting (if dangerous, too) to get some
public, proper information about Falcon's accelerating too. I once asked this in the
"Atari technies" area, but nobody took any interest. So, perhaps this subject
is silly 8-) !

Under MagiC, Calamus SL locks out keyboard input. What you need to do
is run the freeware patch, CALAPAT.TOS over SL, and it cures the problem,
so SL works fine under MagiC. You should be able to find this on a FTP
site somewhere.

I don't know about 1.09 off hand though.

I have the following Atari ST programs for sale. They are all
original disks but, with exceptions noted, are parted from
their documentation.

I pay postage at the prices shown to anywhere in the US.

Their Finest Hour, The Battle for Britain, on 2 disks. $9.

The Black Cauldron: Sierra Software, Walt Disney, on 2 disks. $9.

Falcon: Spectrum Holobyte, on 4 disks, $13.

King's Quest: Sierra Software, 2 disks plus a 360 page book
"King's Quest Companion," all for $10.50 (The book by itself is cover
priced at $14.95)

King's Quest II: Sierra Software, 2 disks $9.

Flight Simulator II, 3 disks (2 are scenery disk) $10.

High Roller: Mindscape, 2 disks, $11.

--------the following programs are each on a single disk----

STWars: Miles Computing $7.50

Outrun: Sega $7.50

Hades Nebula: Gamebusters (requires color monitor) $7.50

Airball: Microdeal $7.50

Super Cycle: Epyx 7.50

MadLibs, World's Greatest Party Game: Price/Stern/Sloan $7.50

ALSO

PrintMaster Plus: Kyocera Unison Inc. $13.

: to the 130XE" department so I must not be up to date with what
: other people are doing in the company.

: Please humor me and explain to me how my co-workers are responsible
: for crippling the Pentium. This I have to hear. Ok, Chris, I'm
: all ears.

Microsoft can cripple any processor. It's poorly written, bloated code.
Microsoft cares more about making a buck than making good software.

NT requires 16 megs just to run the OS? GET REAL!

Microsoft in a nutshell:

The processors speed up, so the code slows down to compensate

Users get more memory, so the software grows to fill the extra space.

You see, Mr. Microsoft programmer. Faster processors and more memory are
supposed to be there so WE, the USERS can do more, not simply for us to
try to keep up with the OS programmers.

If Microsoft some day produces a decent OS that can fit in less than 2
megs of RAM and less than 5 megs of HD space, as well as run efficiently
on something as slow as a 286, then MAYBE I'll respect them. Until then, no.

You see, I want to use the other 14 megs of my RAM to run APPLICATIONS,
not the rest of the OS. I want to use the rest of my 300 meg HD to store
APPLICATIONS, not the rest of my OS. I want the extra 100 MHZ of my
processor so I can run APPLICATIONS fast, not simply so that I can
tollerate my OS.

Source record: 174456

Does anyone have any clues as to where one would obtain a/the fix to enable STOS to support _at least_ the 320*200*256 mode on the falcon, and possibly the DSP. This is almost as important over here as MiNT is to you guys, so any assistance would be appreciated!

Does anyone know if Mandarin finished writing FalcOS but just never released it? If so, we may be able to write them a letter and ask them how much they would want for one individual copy...

Actually, the timing is just about right...mainstream computing is just
getting ready to leave the 680XX architecture behind for PPC. Personally,
it seems like the best chance for an 040 Atari is MagicMac on a cheap 68040
Mac clone.

>2) Can Falcon handle IDE CD-ROMs, 2 CD-ROMs, and over 500 Mb sized HDDs?

Yes, yes, and again yes ;-)

If you're talking about the industry-standard IDE/ATAPI-drives, you can connect those to a falcon. E. g. Mitsumi FX300. Forget about those really cheap Mitsumi FX001x drives. They have a vendor specific interface and won't work. (I've written this at least once before).

I dunno whether you can connect 2 of those to the Falcon as a Master/Slave combination.

Undoubtedly this will work with SCSI-CD-ROM's.

But, you'll need a driver wihch is capable of CD's connected to IDE. AFAIK the only one available right now is CD-Tools from Hard & Soft, Germany. Even multiple CD's are no problem at all. CD-Tools comes with a nice installer and a nice lil' Audio-Player. With some drives, e. g. Toshiba XM's you can transfer the Audio-Data digitally via the SCSI-bus.

Big HDD's work as well. Why shouldn't they?

But that's not Mag!C's fault. If Cubase would use standard OS-Calls and proper GEM it would work. But it doesn't and so it fails. As it probably would on any new machine, e. g Medusa or Eagle.

5505. Geneva/CS-TeX

Newsgroup: comp.sys.atari.st
Date: 1994-12-16 20:14:48 UTC
From: thopman@uoguelph.ca
Message-ID: <3cssfo$8c4@nermal.cs.uoguelph.ca>
Source record: 174467

OK, so I've got Geneva (which works great) and CS-TeX (which by all accounts is also great) running on my system. When I use the CTEX shell that came with CS-TeX, there's a relatively minor problem when the shell runs the various .TTP TeX programs. What happens is the programs run the normal way, just the way they would under regular TOS (ie clear the screen, start printing text, etc, just like a regular .TTP program). The programs work fine, produce excellent output, etc. etc. However, once they're done, they run _again_, this time under GenevaTOS, doing exactly the same thing. The same thing happens when I try to edit a file. I've got Everest installed as my editor, and the CTEX shell runs it once in single tasking mode, then again in multitasking mode. What's going on here? Is there any way I can avoid this? It's not a life threatening problem, but it is irritating. I've noticed the same thing with other programs as well, although I can't remember which ones.

In case it helps, I'm running a 25 MHz Mega 4, TOS 1.04, hard drive. I usually boot up with HDRIVER (1.44 meg floppy driver), LEDPANEL, Petra, Paula, X-Control, Geneva Task manager, and of course, Geneva.

Please reply in email, since I'm going on home for the holidays (YAY!) and won't have news access for 3 or 4 weeks.

I dunno. AFAIK CoMa supports the ZyXel voice functions and those Rockwell
voice chipsets.

Perhaps the Supra will be supported in the future. Ask

siegfried_hartmann@b.maus.de

about this. I have my doubts, though.

Well said Scott. I have a PC & a Falcon and theyboth have their
strengths. For a start the Falcon doesn't require 1/2hours messing about
with configuration changes every time you add an application.
The audio is very nice and the DSP unpacks JPGs as fast as my 486 if not
quicker.

5510. Power supply pinout

Newsgroup: comp.sys.atari.st
Date: 1994-12-16 20:45:58 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <3csua6$b66@mailer.fsu.edu>
Source record: 174469
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have obtained a really old 520ST, the type with no internal floppy drive or power supply. For the latter, there was a "power brick" thingie that plugged into the wall and the back of the computer. Unfortunately, I do not have that power brick. It had a round female connector with about 4 pins in it.

Does anyone have a pinout diagram for that power brick? I could probably cobble something together if I knew which pins needed what voltages.

Of course, if anyone has an extra power brick like this for sale, I'd be interested as well.

Please email responses directly to me. Thanks much in advance.

Why don't they use DRAM instead? DRAM is a lot cheaper than VRAM, even
if the DRAM is faster. There are several interleaving techniques that
will produce the same capabilities of VRAM in twice as much DRAM.

5514. Path for CLIPBRD... Help !

Newsgroup: comp.sys.atari.st
Date: 1994-12-16 21:33:06 UTC
From: npetrlik@public.srce.hr
Message-ID: <3ct12i$ens@nippur.irb.hr>
Source record: 174473

I'm using 1st Wordplus 3.20, and i'm
interested is it possible to set the
path for Clipboard to C:\CLIPBRD ?
Cause dummy 1stW. saves CLIPBRD dir
in the current directory ..
although in the WORDPLUS.PRG file
stays C:\CLIPBRD ...
But hear this:

All the prg's use clipboard path
C:\CLIPBRD (if hard disc is present),
but:
I start a 1stWord+, use a clipbrd,
then use a LZHSHELL, use a clipbrd,
and LZHSHELL think the clipbrd is
in the dir. where 1stWord+ put his
clipbrd ! (D:\TEXT\1STWORD\CLIPBRD) !
So, I was thinking, maybe some sys
variable, or a short assembly prg
could handle this ?
Maybe in desktop.inf ?

I'm using Teradesk 1.40, my
TOS version is 1.04 (1040STFM),
and i have a MEGAFILE60.

Please help!

Thanx.

>it a mix of technical mis-nmatch and good luck!

You are taking a huge risk with you data by using HD disks in a DD drive!
Don't do it!

The compounds used to coat the magnetically sensitive platter are chemically
different. DD use a ferric oxide whereas HD used a barium based coating.
The two require _different_ levels of current in the drive head to align the
magnetic particles properly.

If your DD drive can register your data on a HD disk then the drive head and
circuits must be operating on the edge of their tolerances, and you
should be prepared for the day that you insert the disk and find all data
lost...

>and so they don't have that LED/sensor thing. All newer and PC drive have.

Absolutely right William.
All HD drives that I have come across (and I have installed them in STs as
DD drives on more than one occasion) use an LED coupled with a photosensitive
cell to detect the existence of the hole in the corner that identifies HD
disks.

BTW there is often a jumper on the drive board which will allow a HD drive
to operate correctly as a DD drive on an ST.

Darek Mihocka (darekm@microsoft.com) wrote:

: The Atari ST emulator for PCs, known as Gemulator 3, is not a free product.

Please refrain from advertising in that tone. There is no THE Atari
emulator for PCs

: About 3000 Gemulators are currently in use by Atari users all over the world
: who made the intelligent choice to buy a real computer rather than waste money
: repairing their old Atari computers (which are no longer supported by Atari).

If you want to make intelligent choices, there are some available:
a) Stick to your old Atari, which is supported by thitd party developers
b) If you wanna change toa PC, use the
Janus board
instead, which is a fully featured hardware emulator (with 68000-16
processor) and runs in fual mode (i.e 68000 + PC CPU, which results in
speeds of about a factor of ten compared to a TT)
c) Buy an Atari clone, such as the Eagle, The Medusa or the upcoming
C-Lab Falcon
d) Upgrade to a Macintosh with Magic Mac.

IMO, buying a software emulator under such hard competition is like
buying a toy, you are going to fool around with it for some time and due
to inusabilty you will forget about it some time later.

: If you need a more complete dealer list or info about either the Atari ST
: emulator for DOS or the new Mega STE emulator for Windows, drop a note to
: Gemulator's manufacturer:

: Branch Always Software
: 14150 NE 20th St, #302
: Bellevue, WA 98007
: U.S.A.

: and ask for a product catalog. You cal also find reviews of Gemulator in
: recent issues of ST Applications, Current Notes, and other magazines.

> a difficult marketing feat.

Which is why rushing out to buy a Apple PowerMAC is not necessarily the
good investment it might look now. IMHO in a couple of years from now there
will be a standard for PPC machines, and anything that doesn't comply
might as well not have a PPC chip in it at all.

Roland.

A well designed 040 accelerator is going to blow the Falcon (and TT for
that matter) away anyway. I'd be surprised if many Falcon owners could
afford to buy a 060 accelerator. I'm sure many of them would consider it
just *too* expensive.

> Cause dummy 1stW. saves CLIPBRD dir
> in the current directory ..

You need a program which sets the clipboard path before you run 1stWordPlus. This program should set the environment variable SCRAPDIR to C:\CLIPBRD (capital letters are important for 1stWP!) and then do some AES call to inform the AES about this path.

I can't tell you how to write a program like this (I'm not a programmer) but in case you use GEMINI (oh no, I just noticed it's TERADESK on your system) you could add the following lines to your profile:

```
setenv SCRAPDIR "C:\CLIPBOARD"
setscrap -q $SCRAPDIR
```

This will only work with GEMINI's internal mupfel. The external mupfel.ttp doesn't know the `setscrap' command.

Andre

PS: Does anybody need a translated version of the gemini.faq? The German version is being posted once a month on Mausnet and since I have some spare time now I could translate it.

Just a thought.

I don't know if anyone else has considered this, but, given the market C-Lab and Emagic pursue, it seems possible, even probable, that they will not be developing or marketing general-purpose computers. It occurs to me that there is a great possibility they licensed the Falcon technology with an eye toward developing one or more highly specific applications such as, for example, a digital audio workstation, based on the Falcon.

Nice, truly nice. Anyone with this attitude should delete all the programs
from Germany from his HDD to get rid of that Evil Nazi Impulse (tm) now!

This includes Papyrus, Calamus, GEM-View, ConNect, Hermes, UPoint, Cubase
Audio, etc., etc..

Or he should buy hmself a time machine and get to the time where this
'impulse' was appropriate.

Unfortunately, things aren't any better on a Falcon or TT as the processor
just sits and waits until the DMA transfer is over... The IDE in the Falcon
is totally processor driven, just like the PC, but that's the inheritage
of the IDE PC mess.....

Does anyone know if Linux (or the newer versions of Mint) handles SCSI
interrupt driven ?

Richard MORRIS (richard@stingray.manawatu.gen.nz) wrote:
: If I went out and bought a Falcon today,
: what else would I have to buy with it?

: Everyone seems to have accelerator boards - would I need to buy one as well?

No, not immidiately anyway. A 16 MHz 68030 is roughly 4 times as fast as
an 8 MHz 68000. Personally, I would like an accelerator (who wouldn't),
but so far I haven't seen any that appeal to me. (price, FPU, FastRam)

: Should I use a TV or SVGA monitor or even RGB monitor? I would like a
: standard PC-equivalent resolution of 1024x768x256 colours (all my friends
: have this from scratch, so it's no big thing).

I use both a VGA and an RGB. What you need/want is the key issue here.
VGA: Nicer display (fot your eyes), in some ways higher resolution and
some nice software demands VGA.
RGB: Not so nice display, in other ways higher resolution
(overscan/truecolour), and some nice softs demands RGB.

Best would be if you could get hold of an multisync that could handle
both VGA and RGB signals.

: From what I have heard, it appears that IDE drives are effectively faster than
: SCSI in Falcons - so would I be better off getting a 540 Meg IDE?

Maybe, I'd prefer a SCSI though.
IDE: faster throughput, limited to one 2.5" IDE, unless you get a tower,
faster booting than a SCSI.
SCSI: Slower, more drives. boots slower than IDE. (There is a hack that
corrects that though)
I'm not 100% sure that SCSI is indeed slower than IDE, but it sure looks
that way.

: I also hear that the Falcon has a 2 1/2" drive instead of the "standard" 3 1/5"
: But I can fit one into the Falcon by removing the internal speaker?

Don't think so. Unless you get a tower for your Falcon.

: It has an internal speaker then I presume? What happens if I remove this?
: Would I lose any specific sounds? Or was it just put there in case you bought
: a SVGA monitor without sound? Would I need to hack bits off the computer to
: get this drive in?

Nothing. I've removed it without problems. It's no good anyway, I'd
recommend that you remove it in any case.

: Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
: and more RAM ?

NVDI is very nice, I'd recommend it to anyone getting an Atari.
4 meg RAM is sufficient. 1 meg is unuseable. 14 meg very nice.
Get a four meg Falcon, and if you get a accelerator, get some fastram.

: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
: Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?

Falcon has it's own memory-cards. But there are a lot of third-party
simmcards around that you can buy. (100-150 USD is an estimated cost)

: I realise I would be stuck with the keyboard attached to the computer *sigh*,
: but understand that the keyboard is much better than the ST I am using now?

Basically, it is the same keyboard. You can get a detached keyboard from
a Mega or TT and use it with your F030. I've done it.

: So basically, I would like to know:

: Just what would the cost be, after I cover all the hidden (but necessary) costs
: of buying a Falcon? I would dearly love to buy a Falcon, but if it is going to
: end up costing the same as a PC (I can get an Intel 486 dx2/66, 8 Meg, 540 IDE
: enhanced, SVGA monitor 1Meg video ram VESA[or something], soundblaster 16 bit
: stereo, plenty of software free, Borland C++ for the student price -a third
: of the standard retail price] - forgive me if I have missed anything).
: Oh the computer is a Compaq Prolinear btw. (so it's not the cheapest PC).

Depends on what you want. A Falcon 030 4/0 (4 meg no hardrive) is almost
a complete computer. What you would need is a Harddrive and a monitor.

: The PC above would cost (last month's prices): $NZ3800 (about $US2400)
: A Falcon (4 Meg and _NO_ HD, _NO_ monitor...): Approx.$NZ2100 (about $US1324)
: not far off 1/2 price, but that's without a 540Meg HDD ($NZ500 - $US315),
: a monitor (not too sure of the cost), and a whole bunch of software - C,
: an Assembler for the '030 and DSP) and any GFA Basic update for the Falcon.

: Oh yes, and cables too - some monitor cable to attach a Monitor (SVGA or RGB)
: to the Falcon (at least I already have a SCART for a TV) - they usually cost
: a fortune.

You should get one adaptor of your own choice for free with the computer.
Some dealers would want to charge you extra for that, tried it with me.
I declared it a greedy attitude and started to go. I ended up with one
for free. (It doesn't cost very much, maybe 30 USD tops)

: And ignoring the fact that there are a _lot_ of PC dealers in New Zealand - but
: _no_ Atari dealers - this is vital if I want to see software b4 I buy it rather
: than having to try get hold of an illegal copy, just so I can preview it before
: actually buying an official version from overseas!!!

: I'm not trying to convert people to PCs (else I'd be saying this in .advocacy)
: as I myself _love_ ataris. But the problem is - is it really worth buying a
: Falcon? Please give me reason to buy one (next year when I have the money).

Reading all your arguments. I would recommend you to buy a Falcon 4/0
with an RGB-adaptor, and use it with your scart-TV.
Get an external SCSI-drive. (costs a little more, but I prefer SCSI over IDE)
Then, if you have the money, and wish to obtain a VGA-monitor, get it!

Another point is that if you get a SVGA, there's nothing stopping you to
use it with a PC if you decide to buy one at a later point.
(It would lower the cost of the PC). Same goes for simms if you decide to
get one of those simm-cards and so on.

I bought my F030 for the only reason that I like Atari. (I've got a 486
DX2-66 as well). But I've carefully configured my Falcon (and even spent
more money than really needed) to get hardware that I know will be
useable even if I decide to get another computer. (PC/MAC/whatever).
I see that as an investment for the future.
Most of my stuff I can use both with my PC, and my F030. Like harddrives,
monitors, CD-rom, memory, laser-printer, etc.

Anyway, if you like Atari, there is no real reason not to buy it.
Unless, of course, you don't have the moeny, or there is something you
have to be able to do, but can't with an Atari.
Before you decide, think about -why- you like Atari, is it because of the
OS? Easy to program? Any special programs you like? etc
I've got loads of reasons why I like Atari, and even got some as to why I
like PC. There are things I don't like with both. (They do complement
eachother pretty good)

Still, I like my Atari the most, and use it atleast 5 times more than my PC.

Just my opinion!

Regards, Tommy

Although you are correct that the Gemulator is not the only one Atari ST
emulator, you are incorrect in your assumption that the Gemulator is a
software emulator.

: A well designed 040 accelerator is going to blow the Falcon (and TT for
: that matter) away anyway. I'd be surprised if many Falcon owners could
: afford to buy a 060 accelerator. I'm sure many of them would consider it
: just *too* expensive.

: Roland.

: @CiX

I spent some time at a Motorola office here in San Diego, CA. I was told
that the 060 is not very much more than the 040 price wise. Therefore,
there is really not much problems in getting the 060 in place of an 040.
The 060 is bus compatible with the 040, so the 040 type upgrade would be
needed in order to run the 060. This is where the real expense would be,
no the cost of the CPU.

Motorola rules.....

His point is simply that there is a place for everything and this is not the
place for binaries or green cards. If everybody took yours and the original
attitude Usenet would be an even bigger mess than it is and people who download
news to read it would be penalised.

NOS will allow you to use a service provider like Demon in the UK to
FTP, Newsgroups and Email all from the comfort of your ST.

An archive containg all you need to get going (apart from an account) was doing
the rounds on BBS's sometime ago so is probably available at a boardor ftp site
near you.

Supra V32bis and a Hayes Optima 288 niether of which came with software for the ST. There are plenty of terminal programs around if your brothers intention is to access the net via a bbs system but if he's going to opt for a slip account with the likes of demon in the UK then he has only one option (as far as I know) and thats the NOS package.

It can be a bit of a pig to set up if its his first attempts at comms but does yield some benifits in the long run.
#

> two: is there a good ftp site for atari software and utilities ?

Hensa has a good selection but its not the only one.

> three : are you linked up to Deamon or the such to get this News
> service (being on a SunSparc these trivial matters of how
> i actually get the services don't bother me ;))

I have a demon account which I access using an ST, I also have an indirect link via a BBS system but that is limited to mail only.

> four : can he get S/W to get mosaic, or is it too slow and a waist
> of time?

I know of none but I don't know it all and would be delighted to have someone say I was wrong and tell me where to get it :-)

> five : how much is this all going to cost .....

Difficult to answer ... Demon will set him back about 12 quid a month plus an intial joing fee of IIRC 25 quid. Phone bill on top of that but no surcharges for online time or use of local access points.

> six : what modem protocols do you have to comply to ?

The modem/comms standards available for him to use will be dictated by the service provider he chosses to use. Generally buy the fastest modem he can afford, something that will do V32bis but V.FC or V#$ if he can stretch to it. Most of the UK service providers currently support speeds to V32bis with faster speeds being in the minority but they will IMO offer V.FC and or V34 soon.

> Realy what would be a great help, is a detailed description of
> how you're doing it, so I can pass on the info.

I can access Demon on the ST using a Hayes modem and NOS

The file STNET100.ZIP contains all he needs to get him going for ftp, mail and newsgroups via demon. Its a big archive, approx 1.2MB and available from my BBS and no doubt others to.

Format the discs on the PC and 720K DD DS and the ST will happily read/write to
them. Alternativley if the ST in question has the later TOS versions it can
format a disc to MSDOS format.

Or thirdly use something like FCopy III on the ST again to format the disc to
msdos format.

Actually the PowerPC has two versions of its architecture: 32 bit and 64 bit.

The currently available chips (601, 603, and 604) are all the 32 bit
architecture (32 32bit general registers and 32 64bit floating registers
^^^^^^^^^^^^^^^^^^^^^^^^^^
with a 32 bit effective address, a 52 bit virtual address, and 32 bit
physical address.

The only chip announced so far that implements the 64 bit architecture
(the 620), isn't available yet. It DOES provide 32 64bit general registers
and 32 64bit floating registers with a 64 bit effective address, an 80 bit
virtual address, and a 64 bit physical address.

So while the PowerPC does have a 64 bit version of its architecture, MOST
PowerPCs that will be sold will be the 32 bit architecture.

5551. If you have a FAX, why not use it?

Newsgroup: comp.sys.atari.st
Date: 1994-12-17 19:42:35 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3cvevc$dll@usenet.INS.CWRU.Edu>
Source record: 174415
Cross-posted to: rec.games.video.atari,alt.games.lynx,comp.sys.atari.st,comp.sys.atari.advocacy

Everyone knows that FAXING is much cheaper than sending mail through the U.S. postal service. Also, a lot of people have FAX modems and FAX software for their PCs...

So if you are interested in seeing some of these companies making games for the Jaguar, why not FAX them and let them know? The FAX number has been included for each of these companies.

Capcom USA Inc.
LucasArts Entertainment Co.
NovaLogic
Virgin Games
Spectrum Holobyte
Psygnosis
MicroProse

>>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And LucasArts also has the rights to BallBlazer which is still a popular game and enjoyed by many.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CAIN Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to thank the company and to encourage them to make more titles for the Jaguar. Virgin is suppose to be making Cannon Fodder, Demolition Man, and

Dragon for the Jaguar. The company is also planning to make a CD-ROM game called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called: The 7th Guest. It has also made Land of Lore, Dune II, and Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest (and name a few) besides the ones the company is already making for the Jaguar.
6) How you would like to see the Jaguar modem and network features used in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game. The game can even be played through the modem on PCs. Spectrum Holobyte has just released Fields of Glory and is rumored to be working on Falcon 4.0.

Modem games is something that a game system must have if it will be successful in the future. And Spectrum Holobyte is well-known for their modem games. Falcon 4.0 sounds like it would be perfect for the Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte

2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number: 510/522-2138. But please keep in mind that sending a letter through the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis' popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced

for the Jaguar.
7) Thank the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174.
But only FAX MicroProse if you do not have time to mail the letter or if
you have already sent mail to the company.

********** THANK YOU! **********

AL> in your highest score!
AL> Andy

Hmmm... you don't see a scoreboard, is it totaly black below the table
or is the bottom of the table at the bottom of the screen on your monitor?
What I wonder is are there space between the table and the screen for a 32
pixels height score board?

Greetings from Michael Brunnstrom

No there isn't, not sure if there is enough interest for one.

Comp.sys.atari.forsale would be the logical group, alt newsgroups are
not always accepted but they are very easy to create, I don't suggest
creating alt newsgroups though as they are afterall "alternative" and
not every sysop likes to have them either.

Cheers

I know you can use Gemview and Speed of Light to convert
J-Pegs, but what about JPEG5BIN..

But is the JPEG5BIN better, or do I get better results using
Gemview, or Speed of Light...??

I would like to convert them to what ever standard that works best
with Photochome 4 and a STE....

Does TARGA give better results with Photochome 4....

Thanks.....

I met someone once who had a Marpet 12Mb expansion in his MSTE. Apparently
it is very good - but not made anymore (or so he told me) :-(

This expansion came in several models with a different one for the STE than
the MSTE one. I never did determine why there was a difference. AFAIK the
standard STE model is still available.

I only have a UK phone number for them: 01423 712600

5557. How to read Atari disks on a PC?

Newsgroup: comp.sys.atari.st
Date: 1994-12-18 01:54:15 UTC
From: jgyip@mailbox.syr.edu
Message-ID: <jgyip.4.00D735A3@mailbox.syr.edu>
Source record: 174362

I have a number of DSDD disks formatted by my Atari 1040ST-F containing files which I would like to read with my IBM-compatible PC. I am unable to use my Atari for this, since its monitor seems to have died.

I understand that the difference in format between an Atari-formatted DSDD and an IBM-compatible disk is small, and that an Atari-formatted disk can even be changed to be readable by an IBM-compatible with a few changes with a sector editor. Does anyone know the way in which this is done? Or any other way to recover the files from the disks?

If this is a Newbie question, please excuse it, but I couldn't find a FAQ for the Atari-ST, and I couldn't find the answer to this problem in other postings.

Thank you,
John Yip

In a previous article, hutch@ilmen.lanl.gov (Hutch) says:

>I just heard last night that 'Gadgets by Small, Inc.' has declared bankruptcy.
>
>I have no other information to share about their situation other than to say
>I'm really sad to see this happen. It is a drastic measure to take and I can
>only wish Dave and Sandy Small the best in any of their future endeavors.
>

This isn't good news. But Dave Small had a lot of problems since his boy
was hit by a car. I'm pretty sure that is what happened to his son.

I'm surprised he declared bankruptcy. I guess he had a lot of bills that
weren't getting paid.

He should put the Spectre code on disk and then have it accessed through
the Gemulator on a PC. PC users will be able to at least run some of Mac
software...

>>on purpose from a properly titled posting.
>>
>>I hate to have to sit through so many screens of unwanted text scrolling by.
>>
>>Give us a fukkin break.
>>

>Oh, C'mon John. Now don't tell me that you don't have paging on! Who
>reads messages without paging?

I have paging on but if I figure an article will be short and something I'm interested in I hit an uppercase "N" and let the message scroll by. I'm a fast enough reader that I can usually catch all I need as it flies by and if not I'll use my scrollback buffer to review it. Much less trouble than having to hit SPACE at the end of each screen.

>All you have to do is press "q" after the first page if you don't want
>to read it anymore. It is THAT simple!

The simplest would be to either keep non-Lynx related posts out of this newsgroup or make it known in the subject line that it's about the Jag. The purpose of the different newsgroups is to segregate the postings according to the reader's interests. Why not respect that?

>I don't know if you have noticed or not, but the Lynx -is- an Atari
>product so alt.games.lynx is an Atari newsgroup. Some people don't
>check out the other newsgroups and own a Jaguar.

It's an Atari *LYNX* newsgroup. "Lynx" is a subset of Atari. "Atari" is not a subset of Lynx. It has no more business there than a Mac posting would have in the Apple II newsgroup.

If you think that there are some stray Jag owners lost in alt.games.lynx why don't you just make a post guiding them to rec.games.video.atari instead of trying to move rgva here.

>I'm going to be releasing a Lynx Letter Writing Campaign next month and
>I'm going to post it in the Jaguar newsgroup too! If you don't like

>that, tough! <g>
>
>Len

Actually I don't like it. <no_g> There's too much crossposting-anarchy already and I hate to see anyone contributing to it, even for a cause that I'm sympathetic to.

BTW -in case you don't remember- we met at the Chardin Atarifest. I have 3 Lynx in the house with about 40 titles, a Jag with 6 titles and well over 300 titles for my Atari 2600 and 7800. I'm not anti-Atari by any stretch of the imagination. I just think that newsgroups should be respected.

I have just had a play with JPEG5, gee what a problem to get it to run,
very bad Doc's...

Problem is none of the output files GIF/TGA will work with Photochrome 4,
do I need any more that 2 megs to use this program, the file JPG
that I was using was OK when converted with Speed of Light, and then viewed
with Photochrome 4...???

The GIF file that came from JPEG5 just locked up Photochrome 4, and the TGA
file just gave a garbled screen...

Any clues...???

Yes I do aggree, just bye a PC clone, that would be far simpler..

IDE is not the way to go, SCSI II is the same price here, there are far more
things that are SCSI than IDE....

Real systems use SCSI not IDE.....

I used to bother the Mark Williams folks pretty regularly. They told me
that all the 3.0.x versions were the same binary. The last digit tells
them stuff about what distribution channel it went through, and what extras
came along with it.
Steve

5569. Atari ST for sale-- pretty cheap.

Newsgroup: comp.sys.atari.st
Date: 1994-12-18 07:04:45 UTC
From: toddya@aloha.com
Message-ID: <3d0mud$47@mango.aloha.com>
Source record: 174372

I have to clean the house a bit.. thus I have an Atari ST for sale.

Atari 520ST 512K Ram (the original unit with TOS in ROM of course)
Future Systems External DoubleSided Disk Drive
Atari Color RGB Monitor SC1225.

$175.00 + shipping.

I will split half of the shipping.. Figure about $25 or so.. Includes
quite a few programs (games mainly).

The Atari RGB monitor will hook up to the Jaguar since its scans the
appropriate scan rate.

If you are interested please leave me mail! I will split up the package
(the unit/fdd and the monitor) separately if I must.

thanks!

5570. Connect capture buffer questions

Newsgroup: comp.sys.atari.st
Date: 1994-12-18 08:18:21 UTC
From: hallvart@ifi.uio.no
Message-ID: <3d0r8d$ie3@holmenkollen.ifi.uio.no>
Source record: 174433

I've been using "STorm" for a while now, communicating on the net, until
I started getting problems with the 7up text editor. I have never had
problems with it before, but all of a sudden as I was writing it would
freeze the program, so I'd lose all my hard work. I suspec Storm to have
some bug in it, since someone else also had the same problem.

Well, I've started using Connect, which impresses me to say the least!
The problem is that I don't know how to use it that well, and I'm wondering
about the capture buffer.
In STorm I used to switch between the terminal screen and the capture
buffer, to copy/paste filenames etc. that had already scrolled past.
Can I do this in Connect? I also used it as a form of offline reader,
reading all my new email online, and offline I would just reply to what I
re-read from the capture buffer.
Can I do this as well in Connect?
If not, how should I cope with this? I seem to remember seeing somewhere
taht there was an accessory that captured everything that happened online.
Any help appreciated.
Thanks.

Hallvard, Oslo, Norway

Ah, John, please do not post my private e-mail to you publicly without my
permission. Thank you. If you post a message on this newsgroup, I will post
a response. If you send me a private e-mail, I respond to you in private
e-mail, I think it is wrong to all of a sudden go public with my message and
respond to it publicly. For someone complaining about how public newsgroups
are used, you got a lot to learn!

>changes with a sector editor. Does anyone know the way in which
>this is done? Or any other way to recover the files from the disks?
>

I used to use disk formatted to 828K with no problem from Windows & DOS
on a PC. There were a couple of PCs which wouldn't read the disks, but
90%, if not more, of them worked fine - so I can't see why you would have
to modify them.

Perhaps if you try a couple of PCs??? Maybe one of them will work for you.

Richard.

JPEG5 that I found on tu-berlin, does not work at all,
the GIF output file was stuffed, also you can't run it
from the desktop, due to the command line case bug, you need
a shell or Neodesk...

Was this case bug every fixed in TOS....??

I also ran the Julian Reschke port JPEG4, this produced
a working GIF runing from the desktop, the command line
is not the same as JPEG5, but I had to run JPEG4 from
the root as it could not find the files when in a directory,
unless you gave it a explicit path...

JPEG5 needs a > between the in/out file, JPEG4 does not...

So what is the lestest version of the JPEG source files,
and can some one do a port of them, what we need is the
LZH man Christian Grunenberg to do a port of it, then it will be
Fast....!!!

How about it chaps.... ??

^^^^^^^
wow, another Midimaze clone, big deal

Claiming AvP is a Doom/W3D clone is even more ridiculous than my
statements. In fact, Doom, like Midimaze, has very few tactical aspects.
AvP has these aspects. I like the Death Match mode in Doom most because
then you have to start thinking. But there's not too many opportunities
to play NetDoom :-(. In AvP, the computer controlled characters already
act clever.

> The Jaguar has been said to be 64 bit, but I really doubt it, I really thing

486-25: 25 MHz 32 bit, Jaguar: 13.3 MHz 64 bit. You just proved the Jaguar
is a 64 bit system (25*32 roughly equals 13.3*64).

Since the Falcon has both SCSI II and IDE, It might not be too much of a hassle
to keep both. I do hope, however that they have an option for SCSI Internal.

>Yes I do aggree, just bye a PC clone, that would be far simpler..

Not if you want to run Atari Software... But then again, Roger, you seem to
start screaming "i'm melting! I'm melting!" Whenever people start saying
anything about Atari other than predictions of their demise.

>IDE is not the way to go, SCSI II is the same price here, there are far more
>things that are SCSI than IDE....

SCSI is about 1.5 times the price of an equivalent IDE drive. However, that
doesn't stop me from having only SCSI in my PC.

>Real systems use SCSI not IDE.....

Real systems are anything but a macintosh :)

>I have just had a play with JPEG5, gee what a problem to get it to run,
>very bad Doc's...

Yes, convert the CJPEG/DJPEG.1 files to ASCII with MANASCII.TTP, that
should fix it.

>Problem is none of the output files GIF/TGA will work with Photochrome 4,
>do I need any more that 2 megs to use this program, the file JPG
>that I was using was OK when converted with Speed of Light, and then viewed
>with Photochrome 4...???

1) I'd use GEM-View to unpack JPEGs (to TGA or whatever you want) and only
use CJPEG/GIF2JPG (who introduced the latter, silly name?) to encode
JPEGs.

>The GIF file that came from JPEG5 just locked up Photochrome 4, and the TGA
>file just gave a garbled screen...

>Any clues...???

2) I guess either a faulty version of CJPEG/DJPEG has been used or
Photocrome 4 itself doesn't work properly. Try JPEG4 and retry, this one
definitely works. And if it doesn't: complain to the Photocrome
programmer(s).

MagicMac is Magic the ST OS replacement ported to run on the Mac. It isn't emulation, it runs native. Thus it lets you run all your St software on a Mac, generally much quicker given that bigger faster macs are available.

SCSI slower???? 1.6 megs/second with a Quantum 240 LPS were verified last
year. It's certainly some wrong piece of information you present here.

>: It has an internal speaker then I presume? What happens if I remove this?
>: Would I lose any specific sounds? Or was it just put there in case you bought
>: a SVGA monitor without sound? Would I need to hack bits off the computer to
>: get this drive in?
>
>Nothing. I've removed it without problems. It's no good anyway, I'd
>recommend that you remove it in any case.

One needs external speakers (and an amplifier) in that case, though.

>: Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
>: and more RAM ?
>
>NVDI is very nice, I'd recommend it to anyone getting an Atari.
>4 meg RAM is sufficient. 1 meg is unuseable. 14 meg very nice.
>Get a four meg Falcon, and if you get a accelerator, get some fastram.

I'd also recommend BlowUp or similar expansions. Best one seems to be the
Speed Resolution Card by Hard&Soft, but this one should be built in at
that firm (is it available in the U.S. yet?). It also sets the board
speed to 18/20 MHz and the CPU speed to 36/40 MHz (fan necessary, but
included). Some Falcons do not work properly with 20/40 (mostly Rev.B
boards, AFAIK), though. This _is_ the most expensive method (400,- DMs
plus 100,- DMs for service -> more than 300 US$s.

All the other res. expansions give less refresh frequencies, of course.
But BlowUp soft is and stays the cheapest solution, and also the hardware
expansions (SBII, BU Hard I&II, to name a few) are far behind the SRC.

>: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
>: Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?
>
>Falcon has it's own memory-cards. But there are a lot of third-party
>simmcards around that you can buy. (100-150 USD is an estimated cost)

Some of those have timing problems (monitor blips, etc.) if the wrong
SIMMs are used :-(.

>: I realise I would be stuck with the keyboard attached to the computer *sigh*,
>: but understand that the keyboard is much better than the ST I am using now?
>
>Basically, it is the same keyboard. You can get a detached keyboard from
>a Mega or TT and use it with your F030. I've done it.

You can also buy a tower case + MFII adaptor and use a clone keyboard
instead.

[PC vs. Atari]

I'd recommend the PC if it is just the money that you care about. If you
want MIDI/Recording or similar, I'd favour the Falcon. If it is some
special software package that you are interested in, buy the computer it
is available for.

E.g. JPEG/MPEG with DSP->Falcon, Cubase Audio->Falcon, Calamus->TT or
Atari clone (EPP in mind), not to mention all the Freeware/Shareware
packages available, but
Word->PC, Excel->PC, etc.

>: all ears.

By using it as an 8088 instead of as a 32-bit processor. Seems like a
simple concept to me, but I guess you've been basking in the nerd-glow
of Mr. Bill too much lately.

>Microsoft can cripple any processor. It's poorly written, bloated code.
>Microsoft cares more about making a buck than making good software.

Well, the fact that they're wasting their time (and user's time) using
P-Code for their applications has something to do with it, too.

>NT requires 16 megs just to run the OS? GET REAL!

Hey, I've got no problem with that. DOS/Windoze users still can't get
it through their heads that operating systems with lots of services and
monolithic applications require lots of RAM for stability. Taligent's
got the right idea (componentware instead of huge monolithic
applications that "do everything").

>Microsoft in a nutshell:
>
> The processors speed up, so the code slows down to compensate

It could just be that their compilers have terrible optimisation (and UNRELIABLE!) so they just don't optimise. IBM sped up Microsoft's code just by compiling it with another compiler (Watcom).

> Users get more memory, so the software grows to fill the extra space.

But they don't! MS sees competitor A has a new feature, so they copy it, and add a couple more. Feature creap is what's making their stuff so huge, and it's a very nasty and contagious disease in the current software industry.

>You see, Mr. Microsoft programmer. Faster processors and more memory are
>supposed to be there so WE, the USERS can do more, not simply for us to
>try to keep up with the OS programmers.

Unfortunately, if you want an operating system with lots of services for the users *and* the programmers (and let's not kid ourselves... despite it's brain-damage, Windows has much more available to the programmer... user-interface objects, compression libraries, shared libraries, etc, etc) you've got to pay for it in terms of RAM.

>If Microsoft some day produces a decent OS that can fit in less than 2
>megs of RAM and less than 5 megs of HD space, as well as run efficiently
>on something as slow as a 286, then MAYBE I'll respect them. Until then, no.

Given those criteria, you've got DOS, but it's not an operating system. Try GEOS or Desqview or something.

You're criteria aren't in line with *any* operating system that offers lots of services... MiNT with networking and a multitasking AES takes up more than 2M of RAM.

>You see, I want to use the other 14 megs of my RAM to run APPLICATIONS,
>not the rest of the OS. I want to use the rest of my 300 meg HD to store
>APPLICATIONS, not the rest of my OS. I want the extra 100 MHZ of my
>processor so I can run APPLICATIONS fast, not simply so that I can
>tollerate my OS.

If you had virtual memory (a la UNIX, not a la Windoze) it'd be much less of an issue. On my OS/2 box, I've got 16M of RAM and a 32M swapfile; so 48M of "virtual" RAM. The physical RAM is used to cache code that's being used, and code that isn't being used gets swapped out to make room for more code that needs to be used. At almost any time, I've "only" got 512k of free RAM, but that's misleading because of the way the operating system works.

: E.g. JPEG/MPEG with DSP->Falcon, Cubase Audio->Falcon, Calamus->TT or
: Atari clone (EPP in mind), not to mention all the Freeware/Shareware
: packages available, but
: Word->PC, Excel->PC, etc.
```

Well, I have used both 486 pc's (networked) and I own an Atari Falcon.
Once the falcon is up and running with a nice programme e.g Papyrus
you'll find the choice even harder. If however you MUST have
a powerful database the PC really is the best option. When its
up and running MS-Access wipes the floor in comparison with ST
database programmes.

If anyone can prove me wrong on this point, I'll be well chuffed!! As
I`d like to get a powerful GUI based relational database.

On the subject of price the PC's are without doubt better value but
if your prepared to invest a little more (you'll need a 4mb, HD falcon
SVGA and some progs) you'll get a fast, userfriendly and very
powerful machine. Which is without doubt better than any budget PC.

5593. FOR SALE: Atari ST + C-Lab Creator Software

Newsgroup: comp.sys.atari.st
Date: 1994-12-18 18:08:47 UTC
From: joe@zirconium.mcc.com
Message-ID: <D10qEo.E7H@mcc.com>
Source record: 174380
Cross-posted to: rec.music.makers.marketplace,comp.sys.atari.st,rec.music.makers

FOR SALE: Atari ST, Atari SM124 Monochrome Monitor,
C-Lab Creator Software (3.149)

This is a cheap, powerful way to do MIDI sequencing.
Creator is excellent, and includes the manual. The
Atari includes the mouse and manuals. I really don't
know how much I should be asking for this stuff, so
if you want to make another offer, feel free.

PRICE: $250, I'll pay shipping. COD is OK.

Thanks,

Joe Newman

>I'd apprecaite any views people have of the following hi-soft products:

>Wercs - resource file editor. How easy is it to integrate wercs
It's rubbish. It can't cope with colour icons, or new-format larger
resource files. eg you couldn't use it to edit your deskcicn.rsc

I would recommend Interface instead (about 50 quid, from Compo). That's
a lot of money for a resource editor, but it is quite good, and you get
a modeless dialogue (etc) library with it. The problem atm is that the
manual is in German. The English translation has been done, and it needs
a bit of tidying up before release (according to Compo). Compo promise to
ship the English version to Interface owners when available.

>Lattice C 5.6: Any general views? About programm, docs etc.
It's better than GCC if you are tight on memory (eg only 4MB on a Falcon)
cos it uses a lot less. It comes with an integrated editor/compiler thing
that I don't use (I use a command line shell instead). It also comes with
Wercs. It's about 99 quid atm, I think.

It comes with loads of docs, but they're badly laid out. There isn't too
much info on Falcon-specific stuff or MiNT either.

My point was that there is a difference between observing general guidelines
and common sense, versus being net.cop about every minor thing. And just
because you may happen to pay for your connection doesn't mean that you have
any more "authority" than anyone else expressing their opinions on the net.
I personally welcomed the posting. It was relevant to the discussion, and
interjected some lively humor.

I don't think this license means that C-Lab will be producing upgrade Falcon machines, just OEM equipment based on the current production Falcon.

If I were to build Falcon clones based on technology licensed from Atari, I would build it using 68LC040-33MHz (low end) and 68040-33MHz (high end) processors. I would implement a PCI bus, choose a standard PCI hard and floppy disk controller and a PCI video card based on a well supported chipset (S3?). At boot up, I would copy TOS ROMs into RAM and apply appropriate patches for these hardware changes. I would build it in a PC mid or mini tower case and use a PC power supply. By using "off the shelf" components produced in the thousands for PC use would reduce the hardware costs and open the door for future expansion. The tricky part would be TOS patches for this new hardware. Some compatibilty would be lost, particularly with older stuff, but that would not be a concern since the Falcon is a very small niche market machine. Developers for current Falcon software (particularly productivity and MIDI software) would probably have to make minor if any changes to run on this machine.

>an 8 MHz 68000.

I wrote a program that alternated between number crunching and drawing
the results on the screen. I ran it on both a Mega STE in ST high rez
and a Falcon in ST high rez. The compiler did not optimize for the
68030 (probably 99% of Atari programs are written for the 68000). The
results? The Falcon was 19% faster than the Mega STE. So I would say
that the Falcon is closer to twice the speed of a 8 Mhz 68000 ST for
the majority of non-68030-optimized programs.

Other way round. Of course an ST won't read HD discs, they must be DD. The
reason PCs don't like ST discs from early TOS versions is that the media byte
is set to a value inconsistent with the disc description elsewhere in sector 0.
So if you have a pre-rainbow TOS, format the discs on the PC. If the TOS is
rainbow or a 2.x version, format the discs on either.

Comes free with Lattice C. Seems good enough to me. There is a better one sold by Compo that supports more features of the later AES. WERCS is only OK for more traditional type resource construction.

> Lattice C 5.6: Any general views? About programm, docs etc.
I think it's excellent. However I rarely use it now as most development I do is on a PC (spit). I'll sell you mine if interested...

> Video Master/Colour Master: Does it allow genlocking?
Unknown about the Genlock. The new package from Titan Designs - Apex Media supports various hardware bits that will ultmately if not already include genlock. Video Master is much cheaper though. The Falcon version got very good reviews when released.

> I'm game if you are?

Oh sure. I'd be happy to fill in the shoes of the European correspondent.
However, the problem of an ever-shrinking market remains. That is to say
finding investors for such an undertaking would not be easy. Also, going
half-way (smaller mag, B&W only, etc.) would not be very prudent because
there is neither time for that now, nor is there room for any margin of
error (i.e. no second chances). It would have to be a full-blown full-color
glossy alternative from the start if it's to have any chance at all.

>got very good reviews when released.

Ian, Rod,

you can contact orres@teleport.com for detailed information on the
VIdeo Master, I happen to own one, and for the price it isn't bad at all.
However for higher end video I do not recommend it, for various reasons
such as the file support (which is currently only very local file formats
as supposed to moe standard ones like FLI/C/X). It is not a genlock, it is
a video digitizer which will suffice for most purposes.

Apex Media as software is much better (Naturally) but do no
forget that the Video Master offers sound and video. Expose is also only
a digitizer, NOT a genlock and is in those terms much better, faster and
more professional, better file support, more standard, excellent software,
but also more expensive.

Other packages to consider are the MatDIGI R1 from Matrix and
their falcon "budget" package screeneye and screeneye II.

If you are looking for Genlocks, I believe Titan design used to have
one, but not sure about availabilty, JRI made *some* but haven't heard of
it's status ever since the first few. The Overscan model I don't believe
ever made it's release. The other option is to get a PC VGA external genlock
for around 700 U$D, works fine but costs a bundle too considering that the
hardware really was designed for 640x480 VGA as supposd to Falcon RGB.

Just my thoughts

Cheers

Yat @ Lexicor

ps: we offer APEX Media in the U.S.A. and wil be offering Expose when it
becomes available, for more info email info@lexicor.com

: SCSI slower???? 1.6 megs/second with a Quantum 240 LPS were verified last
: year. It's certainly some wrong piece of information you present here.

My SCSI is slower than my IDE, and judging from what I've seen of the
hardware, the Falcon has the SCSI-interface connected to an internal
ACSI-bus. (Might be possible to extract a fully working
ACSI(DMA)-connector, if you want to connect an Atari Laser to your F030)
The ACSI DMA isn't fast, and the IDE interface is a separate system,
although not DMA-driven.

Sure looks like SCSI is slower than IDE on F030.

: >Nothing. I've removed it without problems. It's no good anyway, I'd
: >recommend that you remove it in any case.

: One needs external speakers (and an amplifier) in that case, though.

That goes without saying.

: >Get a four meg Falcon, and if you get a accelerator, get some fastram.

: I'd also recommend BlowUp or similar expansions. Best one seems to be the
: Speed Resolution Card by Hard&Soft, but this one should be built in at
: that firm (is it available in the U.S. yet?). It also sets the board
: speed to 18/20 MHz and the CPU speed to 36/40 MHz (fan necessary, but
: included). Some Falcons do not work properly with 20/40 (mostly Rev.B
: boards, AFAIK), though. This _is_ the most expensive method (400,- DMs
: plus 100,- DMs for service -> more than 300 US$s.

I'm very skeptic so such solutions, because of:
1: Who knows for how long the chips will last, if run on a speed higher
than it was designed for. A 68030 isn't that hard to come by and replace,
but the complete F030 chipset? Cost?
2: Do you really gain something? (that matters, which is memory-access.)

3: Smarter to get an external board with FastRam. More gained.

: All the other res. expansions give less refresh frequencies of course.
: But BlowUp soft is and stays the cheapest solution, and also the hardware
: expansions (SBII, BU Hard I&II, to name a few) are far behind the SRC.

: >: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
: >: Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?
: >
: >Falcon has it's own memory-cards. But there are a lot of third-party
: >simmcards around that you can buy. (100-150 USD is an estimated cost)

: Some of those have timing problems (monitor blips, etc.) if the wrong
: SIMMs are used :-(.

Wrong! There are no timing problems. The problems derivates from the
power-consumtion of the simms. Some simms need more power, and if the
card is badly designed, it will generate "ripple" on the power.
(The voltage will pend at a very high frequency between maybe 4 volts to
5 volts. And thus will the simm not work properly.) A ccouple of
capacitors placed close to the simms will remedy that problem.

: >: I realise I would be stuck with the keyboard attached to the computer *sigh*,

Prove it. Show us how gifs of a Pentium are relevant to each of the
following groups:

comp.sys.acorn
comp.sys.amiga.misc
comp.sys.atari.st
comp.sys.mac.misc
comp.sys.next.misc
comp.unix.misc

Be sure to include specific references to each groups' intended purpose,
which was defined when the group was created.

-Chuck

PS: Kartik, I predict that you will be unable to demonstrate any level
of relevance. If that is the case, I hope you have the intellectual
honesty to retract your comment above and agree that those posts were
inappropriate for 6 of the 7 groups involved.

5614. Re: How to read Atari disks on a PC?

Newsgroup: comp.sys.atari.st
Date: 1994-12-18 23:25:46 UTC
From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <D1152y.Axy@murdoch.acc.Virginia.EDU>
Source record: 174388

The difference between MSDOS disks and Atari disks is that MSDOS writes a serial number to the boot sector when it formats them, and the Atari does not. This is why Ataris cans read MSDOS disks but MSDOS cannot read an Atari disk unless you use a program such as Diamond Format to add a serial number to the disk. However, I believe I read somewhere that MSDOS 6.0 and higher do not need a serial number written to the disk to use it, so you can probably retreive your files into a PC if it has DOS >=6.0. Good luck.

Beware that I am not sure if adding a serial number to a disk that already contains data will erase the data; if you do this make back ups first.

> I don't think this license means that C-Lab will be producing upgrade
> Falcon machines, just OEM equipment based on the current production
> Falcon.

Yes this is what I understood. Also didn't Atari say that C-lab had the right to produce Falcons *if* Atari stopped making them, and the Atari had no intention of stopping?

All this talk about what C-Lab will build into the 'new falcon' just seems misplaced. I'd be surprised if they had the desire or capacity to do more that rework units from the Atari production line. This might include all the known hardware fixes. Better RAM and HD expansion, debugged ROMs, 32Mhz (like PowerUP 2) and Blowup as standard (the latter maybe inside the case - or maybe even a new case).

IMHO I think people expection fully 32bit, 32Mhz 68040 machines from C-Lab are going to be disapointed.

> I would build it in a PC mid or mini tower case and use a PC power
> supply. By using "off the shelf" components produced in the thousands
> for PC use would reduce the hardware costs and open the door for
> future expansion. The tricky part would be TOS patches for this new

Now this seems like a good idea. I'd be tempted to chuck in a PC ISA bus as well. Sure each card would need drivers, but at least the cards are cheap and easily available. I think we would soon see many PC cards being supported through the work of interested hackers - much like Linux on the PC is supported.

Roland.

> The results? The Falcon was 19% faster than the Mega STE. So I
> would say that the Falcon is closer to twice the speed of a 8 Mhz
> 68000 ST for the majority of non-68030-optimized programs.

In tests I've done using Dhystone the Falcon fares pretty badly. Its fine if you compare it against an 8Mhz ST in ST-Hi, but as soon as you start running in a decent colour mode the Falcon rapidly slows down. Its quite possible for a reasonable colour Falcon to be outpassed by a mono MSTE.

Which is why I bought a TT instead of a Falcon (didn't need the colour).

Roland.

just in case...

dhrystone is at best a test of compilers. you will see wildly different
results for any 2 compilers on the identical hardware. for example, i
seem to remember the old DRI compilers running 1/2 the dhrystones as GCC.
and merely executing a .ttp is also pointless. you must both compile and
run for dhrystone to even approach anything meaningful. finally, reporting
dhrystone without compiler info (including rev, switch options, etc) is
also virtually worthless. if a compiler has options for architecture (eg,
68030) it should be used. you cannot, for example, take a 68000 .ttp over
to a 68030 system, run it, and expect to draw any meaningful conclusions.

dhrystone is also a CPU-only benchmark. disk, display, and many other
system elements are not tested at all.

be careful in interpreting dhrystone results. in fact, i'd go so far as
to recommend abandoning it unless you really know what it does and how
it does it (ie, study the source code)...

When formatted with TOS >= 1.04 PCs can read your disks right away.

: them stuff about what distribution channel it went through, and what extras
: came along with it.
: Steve

I would not consider linea.h an extra. The one which comes with 3.0.9 is
quite different from the one that comes with 3.0.5. I don't think it
bothers most programmers though. But MW's statement is not 100 % corrent
obviously.

But is Pure C available for the Falcon, in the UK, with English docs?
I believe that the answer to at least two of those is "no".

For us, it's a choice between Lattice and GCC. As Rod only has 4MB (iirc)
he's going to struggle with GCC.

To read ST disks on a P.C there is a program on hensa.micros.ac.uk for the P.C that allows it to read ST disks without any problems, If you cant find it I have a copy and will send it you!!! But I am now going home for christmas so you'll have to wait until 8th JAN maybe someone else will give you a copy of the program???? As for the serial numbers I don't know what they are on about, You could try adding an MS-DOS Boot sector to the disk with DOUBLE CLICK FORMAT this usally works for me and you don't lose data??? It's up to you....MERRY XMAS

No, the demand was so high (apparently) that ASH began selling the
pre-release version (which was marked as such!) with the offer of a
free upgrade to the full release version on, er, release.

5637. Making Geneva change directory...

Newsgroup: comp.sys.atari.st
Date: 1994-12-19 11:33:30 UTC
From: stephen@cavendish.co.uk
Message-ID: <stephen.787836810@unix>
Source record: 174251

I posted earlier about the problems I'm having with Geneva/Gemini.
I'm making (slow) progress on them, but can anyone help with
the following:

Gemini2 instructs Geneva to run programs when I double click on them (great),
however my search paths are in disarray. I think the trouble is that
the 'current path' under Geneva is different to the 'current
path' under Gemini2. I have set up the PATH variable in
Geneva's GEM.INF file to search *all* the folders that contain the
programs I wish to run. This works OK for loading .RSC files,
but if the program wants to load any other data files
afterwards, it reports a 'file not found' problem. It's as if
the PATH statement is examined only once.

I'm comtemplating writing a program that calls the OS to change current
directory. This could then be called by a Mupfel script
before the program I want to run. Does anyone know if it's
possible to get Mupfel to change Geneva's local directory?

For some reason, there's a font clash between
AMCGDOS/GEMINI/GENEVA on my setup.

Certain Gemini2 dialogue boxes have a corrupted-looking font in them.
It may be because a certain font is not available for use, and it tries to
'round-up' the nearest font. I've tried to load in as many
sizes of a font as I can, but I am unable to clear this problem.

It was recommended that I get hold of NVDI3, but I can't find
any info on the cost/availability of this product.

I do have a VDI bug-fix program, but this won't load with Geneva.

Any help would be appreciated

Steve

P.S. Does anyone know the UK contact number for Geneva
support? My docs are back at my parents place.

Digital Tracker plays them too. Howewer it shout that module is corupted
or s.l.t. Just click on play, after reset of pattern and song counters,
so you can listen to s3m (or mtm and 16 bit DTM).
Anyway I found only one really 16 bit DTM (with 16 bit samples) till this
time.

Have a fun.

Simon.

**********************************************************************

======================================================================
Answer with an x inside the parentheses.

Example: Do you have a dog? (X) yes ( ) no

======================================================================

1. Sex?

( ) Female ( ) Male

2. Age?

( ) less than 15 years ( ) 15-20 years
( ) 21-30 years ( ) 30-40 years ( ) more than 40 years

3. Highest education?

( ) Elementary school ( ) High school ( ) College/University
```

4. Where do you live?

( ) Europe ( ) N. America ( ) Asia
( ) Australia ( ) S. America ( ) Africa

5. Where do you usually play games? (make only one choice)

( ) Home
( ) School
( ) Friend/relative
( ) Work

6. What computer equipment do you usually play games on?

a) ( ) PC ( ) MAC ( ) AMIGA ( ) ATARI ( ) OTHER

b) ( ) CD-ROM ( ) MODEM

c) ( ) less than 4 Mb RAM ( ) 4-8 Mb RAM ( ) more than 8 Mb RAM

7. How much time do you spend playing games each week?

( ) less than 1 hour ( ) 1-5 hours
( ) 6-15 hours ( ) more than 15 hours

8. How many games did you buy 1994?

( ) 0 ( ) 1-4 ( ) 5-10 ( ) more than 11

9. What do you think about game prices?

( ) Very expensive ( ) Expensive ( ) OK
( ) Cheap ( ) Very cheap

10. How much do you think the prices will drop if 'illegal copying' is stopped?

( ) Very much ( ) Much ( ) Little ( ) Very little ( ) None

11. What sort of games do you prefer? (make up to 3 choices)

( ) Strategy ( ) Adventure ( ) Sports
( ) Shoot'em up ( ) Arcade/Platform
( ) Flight sim. ( ) Others:
==========

12. Rate these software companies according to your opinion.
(Use a rating scale from 1 to 12, where 12 is the best)

( ) Microprose ( ) ID ( ) Microsoft ( ) Sensible
( ) Lucas Art ( ) Sierra ( ) Image ( ) Digital Illusions
( ) Electronics Art ( ) Ocean ( ) Maxis ( ) Virgin

13. When buying a game, you:

( ) Play the game before reading the manual.
( ) Read the manual before playing the game.
( ) Never read the manual.
( ) Read the manual when a problem occur.

14. What makes you buy a game?

( ) Reviews in magazines.
( ) Recommendation from a friend.
( ) Advertising/Commercial.
( ) Text on the backside of the game package.
( ) Testing the game.

15. Should there be an age limit for playing computer games?

( ) Yes ( ) No

THANKS FOR YOUR COOPERATION.

>it does it (ie, study the source code)...
>
Granted, but the guy's conclusions gave a rather accurate picture of what
a falcon's about. Here's a bit of my findings (I've had a 030 for 9 months
now):
- It's an extremely versatile and easy-to-handle machine
- It's got a louzy keyboard
- Processing speed slows down with increasing colours; works surprisingly
fast in truecolour mode though
- It's a good buy, considering what it does
- In general it lacks power; very few programs know to use the DSP

It does all the stuff 'the other guys' do, but it's too slow for professional
use. If it were equipped with a 040/060 set and more programs had access to
the DSP you'd have a mean machine allright, but personally I wouldn't want
to go through all that trouble.

just my 2c,

Paul

I have manged to get Gulam to run under TOSWIN on my falcon, I do however
have a few problems.

1) it disables the cursor in other programmes.

2) It slow the system down

3) I cannot get the sobocon cc command to work it simple comes up
with and error saying
cc: cannot frin library. 'TERM=tw52'

All I did was rename gulam.prg to gulam to gulam.tos

Any suggestions as to whats going on and how to solve it?

: Windows version. The Atari version is FAR superior.
: Bill R.

Most games for Windoze are pretty poor (Outpost etc. being the
exceptions).

Since you make the comparison, presumably you are running Atari
BattleChess from the GEM desktop?

Falcon-SCSI uses the old DMA unit, that's right. But the limit is the NCR SCSI
controller (around 2 MB/sec). IDE can in fact be faster with the right driver
and a fast disk.

50>mhz.
You got to know if you ask too much, there is already Power Mac for you.
I just don't want the price of new Falcon to be too high.

>Reasonable room for RAM expansion - in the 128 meg range
>Tower Case
>Hard drives and RAM should probably be optional, as many people like to make
>their own config
Agree. But I wonder how many of programs need so much ram.

>DSP - if they could come up with a way to throw in Logic Audio, they could
>build in the dongle into the main board. They do still have the rights to
>Notator, right? This could be a good selling point.
No, I love Cubase.

>Go ahead and build in a 486 board as well. Might as well be compatible with
>those PC's
No need. For the Power Mac or Quadra, even dealers won't recommend Soft PC
or add on PC hardware emulator because buying a 486 is very cheap today.
Anyway, I do hope that there is a cost effective PC emulator.

>Include SCSI-2, IDE interfaces
SCSI2 is a must. For the IDE, if you have an old IDE/second drive, then it
sounds like IDE controller should be there. But I won't use IDE, it is too
slow, and the price of SCSI and IDE are very close.

>Also maybe have a board with lots of audio in's and out's. Maybe even some
>XLR's would be nice. 8 rca in's and out's is a start.
Will that make the cost too high? I think good quality stereo in out is
basic, and should be OK for most of us.

NO Robert!
this is the outdated formula of upgrading ram.
WE should consider using 72pins 36 bits simm. The new simms are longer and
you can upgrade in a more flexible way.
Please don't consider the old type of 30pins simm.

>compatable with the clone out there.
STRONGLY AGREE

Keep the industrial standard:
Plug in SVGA monitor directly without adaptor to have 1027*768 (at least).
Use standard 72pins simm without using Adaptor.
Standard PC tower case (but I don't think it is possible)
(may be even)standard Ms mouse.
Standard printer/modem/SCSI/midi.....OH, almost forget: RCA instead of
headphone plug.

Keep things basic.
Don't ask too much for 68060, 2.88meg FD, True color in high resolution,
FPU, etc. These will shoot the price high and in that case, you better buy a
MAC.

There's no such thing as "too much" so long as a lower end exists. Some of
us won't use a mac even if we were paid to own one.

>>Reasonable room for RAM expansion - in the 128 meg range
>>Tower Case
>>Hard drives and RAM should probably be optional, as many people like to make

Digital Audio, Animation, Image processing, all of these (and others) can
use lots of RAM. Better to have too much expandability than too little.

>>DSP - if they could come up with a way to throw in Logic Audio, they could

>No, I love Cubase.

They can't throw in Logic Audio unless they make a deal with EMagic. Not a
bad idea, but those who want Logic audio may already own it (like me, well
not AUdio yet) and bundling could be a waste.

72 pin simms (32 bit wide) are the best choice. My PC uses the older type,
and even though I "only" have 16 megs, I would rather, for future's use, hhave
it use 72 pin simms.

>Why don't you buy a PC then??
I think that making the hardware use the PC type standards (keyboard port,
monitor port, printer, modem, simms, etc) Makes a lot of sense. The
peripherals are cheaper and easier to find, more selection, and since 99% of
these are standard on the Atari line already (only exception being keyboards
& mice, off the top of my head) it makes sense to continue the trand.

: I have the Falcon Wings with 16Mb SIMMs and that pixel flicker symptom.
: How can I fix that?

To make a good fix for that, I recommend that you consult someone with
good knowledge in electronics.
However, the problem as i stated is ripple on the powerlines.
The solution is to place a capacitor as close to the simm as possible
(1 for each simm) between the power and ground.
When simms demands more power than the board can supply without becoming
sensitive to disturbancies, the ripple starts.
The ripple itself is a high-frequency voltage sinuswave, and by placing
the capacitors there, you get a filter, that removes the ripple.

Regards, Tommy

No, but you will have fewer bugs. IIRC 4.01 has an AES that does 3D
effects differently to the newer ones, so it will be more compatible
with the newer apps as well.

Hi!

M> While we're all dreaming of 040/060, we could spend the waiting time
M> blowing our Falcons up with a bit faster 030 CPUs ;-) ?
Well, the speed up of the bus speed is nice but it wouldn't give your Falcon
the kick he needs. The numbers of the Speed-Resolution-Card (running with
a 40 Mhz CPU and a 20 Mhz bus speed) won't fit my needs. What you need is
FastRAM which you could get while using the Mighty Sonic. And this card
is IMHO the only one which could give your Falcon the speed of the TT.
(Except BEST have released their 040 Board. And compared to PC's even a TT
is a slow machine.)

So hopefully we will see a 040 Board once.
Or perhaps do you want to built one? ;-)

A Merry Christmas and a Happy New Year!

See you in 1995!

> re-read from the capture buffer.
> Can I do this as well in Connect?

Yes, easily. Just click the "copy" button, and you will get another text window that looks just like your terminal one, but is in fact a window to the current capture buffer. You can then cut and paste between windows with no problems. Hit the "help" key and hunt around for the mouse instructions for cut and paste. The printed manual you get when registering the program gives detailed instructions for this (and everything else).

You can also just cut some text from the capture buffer (using the scrollbar to find the text you want in the buffer) and paste it directly into the current window. If you hold down the left button while defining the text to cut, then (while continuing to hold the left down) hold down the right button, then release the left button, then release the right, you will get a popup menu of options for the text you just cut. This sounds a lot more complicated than it is. Give it a try, it's pretty neat!

While I still use my 1040ST, it's now dedicated to MIDI and I do
everything else on a Mac, so I have a bunch of stuff lying around
looking for a home. Everyhting is best offer, because I have no idea
what any of this stuff is worth (if anything).

Hardware:

Monitor Master (switch between two monitors, plus provides an RCA jack
audio out)

Atari Trackball (the big momma)

Chinon SSDD internal drive (removed from a 520 that I upgrdaed to DSDD;
works fine)

Software (with docs, original floppies):

D-Basic compiler

Pascal compiler

Word Perfect (last version; all manuals and can transfer license FWIW)

Oids (game)

Gauntlet (game)

Balance of Power (game)

Battle Chess (game)

Timeworks Publisher (DTP)

PC emulator software (forget the name ?PCSpeed?; emulates SLOWLY, can
run DOS 3.3, CGA graphics, 640K of memory)

Books:

Compute! Atari book

GEM programmer's handbook

All this stuff is located outside of Worcester, MA; all offers
considered.

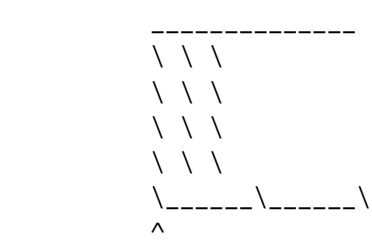
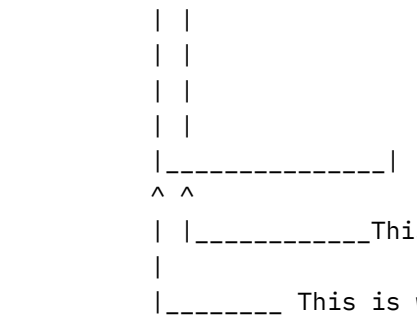
I used STzip version 2.06 (or was it 2.6 ??) to unzip a file
an IBM PC created from PKzip 2.04G (it didn't cross diskettes).
It's a .tga file, at any rate I unzipped it using a TT and it
came out like :



instead of looking like :



Any help on how I can fix this would be appreciated.
Thanks,
Scott

P.S. I unzipped it using PKunzip version 2.04G on a IBMPC and the
picture came out fine.

What is the maximum size for the copy buffer? I also use STorm as Hallvard described, and I enjoy the unlimited size of the scroll-back buffer. In my limited use of ConNect, though, I haven't been able to get more than 500 lines in the capture buffer. Is there any way to store more lines, and cut, paste and "send" from them?

Thanks,
Tom

Couldn't agree more, I've been very puzzled by the show locations, Ulm, Berlin Hennef. I guess the exhibition hall is more expensive at Dusseldorf.

ISTR that Dusseldorf attracted visitors, and exhibitors, from UK, Holland and Belgium, don't think you could say the same for Berlin or Ulm.

5676. Gemulator & DEKA II Questions

Newsgroup: comp.sys.atari.st
Date: 1994-12-19 21:40:43 UTC
From: renfro@bnr.ca
Message-ID: <3d4ukr$5ff@crchh610.bnr.ca>
Source record: 174230

Background: I have a 486 next to my desk with keyboard on desk in front of my Falcon030. I have a VGA monitor hooked up to a switch box to switch between the 486 and Falcon. When I use the Falcon, I move the 486 keyboard out of the way. I would like to have one keyboad on my desk.

Options being considered: I could get a DEKA II and hook the 486 keyboard through the monitor switchbox to the Falcon. The same keyboard and monitor would work as 486 or Falcon I/O depending on switch setting.

or

I could sell the Falcon and get a Gemulator and it would use the same keyboard, monitor, hard drive, etc. as the 486 is currently using.

Questions:

1. Anyone using and recommend the DEKA II with the Falcon?

2. I don't do video or music stuff with the Falcon (other than just playing around) so I don't really need its capablities. Is there any other advantage to the Falcon over a Gemulator running on a 486DX2/66?

3. Can Gemulator drive an HP laserjet printer on the 486?

4. Can Gemulator use the CD-ROM on the 486?

5. How will the speed of the Gemulator on my 486 compare to the Falcon (out of the box).

6. Any other comments or feedback I should consider in making this decision?

If anyone has some specs/info on Gemulator, feel free to mail them too me.

Thanks,
RandyH

Er... what do YOU pay for a one ounce first class letter, Len? I pay $.29 and that's considerably cheaper than what most long distance phone charges are, even for a quickie-fax. No doubt, fax transmissions may get to your party quicker, but cheaper?

Even so, your suggestion that everyone fax their favorite game-maker to encourage them to develop more Jaguar games is worthwhile. I've often seen quicker responses to fax queries than via a posted letter.

_______ Comment Bulletin _______
by
Amalaye Oyake

The Atari Computer is dead, well that is what many are saying,
and some would like to believe. Dedicated Atari Users, Musicians and the
like, are very disturbed by these comments. Yes there is some element of
truth in comments such as these. The depth of Falcon030 software tells all.

So what is to happen ? Where do Atari Computers go from here, at this
point when the Computer Industry is on the merry-go-round. I say *my words*
license the Mac OS, and continue to support the 680x0 line. But don't just
license the Mac OS, make an Atarized Mac Clone, slap on MiNT, and you have
a Mac runningabetterOSthanCopLand + more stable OS. Throw in the Midi ports
make the Falcon features an add-on card and BOOM !!! You have a killer system.
Advantages

1> You can Lure away Mac users *runs all Mac Software*
2> True Multitasking
3> maybe - might - possibility - runs Falcon/TT software

The above are my ideas and opinions. They might be slightly skewed,
but this is an open, unmoderated forum, let's debate this .. Yes ?
How can we carry the Atari computer to the future. The Atari computer
has left a major dent in the music industry. The Falcon provides
a stable base platform to start from.

Lets Talk,

Amalaye Oyake
email -> aoyake@inst-sun1.jpl.nasa.gov *thanks*

Real systems are anything but a macintosh :)

Whatever you say, Chris, but the latest (and last?) Mac 040 machine (the Quadra 630) has an internal IDE drive and an external SCSI port. IDE vs SCSI? Heck, I couldn't care less as long as it's fast and reliable and the newer IDE drives are both.

No, definitely not at $1299! But then, I would not buy *ANY* 030-based machine unless it was an extremely low cost game machine or something. The 040 is far more powerful and not that much more expensive and the PowerPC is far faster still and will, of course, become cheaper.

Hey, as long as we are dreaming, might as well go for the gusto, eh? :)

>Yeah right, so all programmes are _completely_ incompatible and everything has
>to be re-written. Great idea!

Not necessarily, Hendrik. You must understand that the PPC is sooooo much faster than a 680x0 chip, that it makes software emulation of a 680x0 chip potentially feasible. The ONLY reason that has kept Apple's PowerMacs from falling flat on their face, salewise, is because they can run existing 680x0 software right out of the box with little or no performance loss over that of a real 040-based machine and all previous 030 users see a considerable -increase- in performance... all in emulated software.

Any 'new' Falcon built around a PPC with a well-written 680x0 emulator in ROM would be the way to go, IMHO. People could use their existing software until they were ready to purchase PPC-native software as it became available.

Of course, as nice as it would be, I'm not -really- holding my breath for Atari or CLab to do this anytime soon, are you? ;-)

The big question is whether C-Lab will be building machines from scratch
- or just re-enginereing Atari production Falcons.

A 68040, 500Mb HD and uprated graphics are all possible for a reworked
Atari production Falcon. OTOH they are all possible for a current Falcon
owner already (okay so the 68040 upgrade may or may not be available yet
- I forget).

However unless C-Lab build their own machines then some of the inherent
designs problems (like the not so great buses) will not get fixed.

Also what are machines going to cost? Unless the price is in line with
current falcon prices (taking into account differences in HD and RAM
sizes), then the machine hasn't got a chance.

Roland.

Although Gulam is an excellent peice of software - its pre MiNT and very bad news IMO on a MiNT system.

As you have found out - it works but has wierd little problems. Its probably better to dump it and use KSH,TCSH or BASH. These are all ports of proper Unix shells. You need all the utilites as seperate programs as well (unlike Gulam).

better yet: save your drive(s) and your time by buying preformatted
disks. the preformatted DSDD disks for PCs work fine on the ST (though
you may have problems with mediach, depending on TOS rev -- in which
case just insert a normal ST-formatted disk between PC disks).

ok, i'll bite: just *exactly* why is WordPerfect 6 not good? and why is
it not good enough for the atari market? what would be the equivalent
atari option to (say) a 486DX2/66 with WP (windows)? by equivalent i mean
speed, features, ease of use, documentation, printer support, etc. (and
don't just say "windows is garbage"....explain.)

Is there still not an MPEG player for non-Falcon computers? If a junky
486sx can play them, I'm sure a TT could do it!

I'd even settle for a postage-stamp sized, small-frame-rate player in TT-low!

Anyone?

What's the point of running a 28800 baud modem on an ST? It gives
virtually no improvement over a 14400 what with the average file transfer
speed being around 1900cps, out of a maximum of 1920....

If you don't use any form of data compression or error correction,
then getting a 28800 so you could connect at 19200 might be feasible,
but otherwise, you're just throwing your money away.

I'll have to agree with Len, Hutch. If you fax in off hours (after 10 pm
central time), it averages out to be about a dime a minute. Unless you're
really wordy, it should take two minutes tops. And yes, I know the first
minutes is slightly higher - all of 13 cents. Second minute and longer
is even less.

[page after page of moronic squabbling removed...]

SHUT THE F**K UP !!!!!!!!!!

GODAMMIT, WHAT IS WRONG WITH YOU ????

I *_DO NOT_* want to waste my bloody phone bill downloading this crap.

ARGUE VIA E-MAIL, or better still call around each other's houses and beat the crap out of each other, but STOP POSTING your differences here...OK ?

Jeez, how many more of these things are going to appear ? Every other week there's a punch-up in public over some trivial point. I am getting SICK, SICK TO THE BACK TEETH of this selfish juvenile mentality.

I download the usenet group to participate in sensible discussion on Atari gear, like (I hope !) 99.999% of everyone else here, and NOT to get drivel like this in the group.

Oh and BTW, if anyone wants to flame me for speaking my mind (read: finally blowing my top), then E-MAIL IT !!!! Not that I particularly want to receive or read it, but at least save everyone else from reading messages inappropriate to an ATARI group.

I would strongly suggest looking at the desktop-replacement GEMINI and its
associated shell MUPFEL. Those run without problems on my Falcon.
I too was a fanatic user of Gulam, until someone showed me GEMINI+MUPFEL.
MUPFEL has about the same functionality, except that it doesn't have a
built-in MicroEmacs. Now I didn't care much about that, as I'm using
JOVE as my Emacs look-alike editor. And with GEMINI, browsing directories
and executing GEM programs is so much nicer.

a convert and an abdicator :-)
but still smiling...

No, he IS correct, actually. Gemulator does not include a 68000, it emulates one in software. The only h/w you get with Gemulator is a board to hold TOS.

:myself. What do you think about this ATARI Dream machine:
:
: CPU: Motorola 68030 running at 33 MHz
: RAM: 5MB expandable to 36MB

too little, I would like RAM: 16 expandable to verymuch

: Also built in speakers

no

: CD-ROM Drive with Double speed.

why not quadrupple (or at least triple)?

: Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors

at least 15"

: Disk: Hight density

of course.

: HD: 160MB

too small, I would say 420Mb at least.

: Comm: Modem and Comm prog., STALKER 3 for example
:
: Software included: ATARI WORKS, Home Account 2, Stalker 3, also
: 4 CD ROms, plus games ,etc.
:
: Price: US$1299!!!
:
: Think about it, would you by it?
: Will ATARI give you such a sweet deal?

I don't think Atari will give such a deal :-(
(BTW you can buy a machine with a 486DX2/66Mhz instead of the 68030, with
all specification I gave, for 1800NLG = US$1000)

Definitly no ide drives, the performance of them is not good, and cost
wise the SCSI drives are the same price. Newer PCs have a SCSI chip on
the mother board. SCSI is the direction the PC is going.

If anyone is using the UNITERM telecom program to access PINE via your local server, I'd appreciate hearing whether or not you've experienced any problems in uploading files to your server that can later be sent out with outgoing e-mail on pine - a means, in other words, of creating long documents off-line for later e-mail transmission. That's what my local server (Supernet) advises me to do, but a) I have to hope there is an easier way, because b) the "rx" command results in a "receiver cancelled" message as soon as I try to "send" through UNITERM. All suggestions welcomed from countrymen across the big water; please use my e-mail address (waynlein@hk.super.net) to keep from cluttering up the BBS. Thanks.

[Blah on... snip!]

Support is of prime importance rather than a 'do it all' machine; a
promise made by Atari on more than one occasion which has not always been
fulfilled. eg. Falcon - ace machine but lacks the support it deserves.
And incidentally, I only own an STFM 520 (4MEG).

The latest version of 1stGuide plays MPEGs on any Atari in any resolution.
Of course it's slow - even on a TT - but at least it works. It can even play
several MPEGs at the same time, only limited by the amount of RAM and the
number of open windows.

The author of 1stGuide also wrote a DSP-MPEG-Player for the Falcon [DSPMPEG.PRG
which runs in colour and recognises screen enhancers, unlike another well-known
MPEG player, thus switching to and from "true colour" mode without any problem].

AFAIK the DSP-MPEG-player will be supported directly in a future version of
1stGuide. 1stGuide is shareware [DM50].a

Does anyone really *know* the answer?

> Medusa still have the slow atari-bus to squeeze all the data through.
> Especially vertical scrolling is so s-l-o-w, you won't believe it.

I read most of the articles in which Medusa was originally described (as
a home-build project), and IIRC by-passing the ST bus was an important
feature of the design. However, some things just have to be done from ST
RAM: DMA sound, ST video, data transfer for most HD drivers... if you have
a video card on the Medusa bus then scrolling should be fast.

> I wish I had an English version of the MagiCMac-FAQ.

So do I. Even a German one would be handy.

: >>one of these programs. Then I would enjoy using them a lot more.)
: >
: >It is not. The Atari market wuold not suffer a commercial program that
: >bad.

: ok, i'll bite: just *exactly* why is WordPerfect 6 not good? and why is
: it not good enough for the atari market? what would be the equivalent
: atari option to (say) a 486DX2/66 with WP (windows)? by equivalent i mean
: speed, features, ease of use, documentation, printer support, etc. (and
: don't just say "windows is garbage"....explain.)

OK, let's start with the speed issue first. WP 6 on a 486 Dx 2 is, when
it comes to speed, slower than, say, Papyrus on a TT or even Tempus Word
on a Mega Ste. It uses up much more system ressouces not only in terms of
processor speed, but also in terms of hardrive space it requires. A
comparison with Tempus Word shows at least a speed difference of factor
of 4, for exanple in scrolling and searching or replacing. That is *THE*
reason why I use my Atari for writing long documents because there it is
where you need speed every single second and it is of such importance
that it is to label the most important of all features.

When it comes to features, you are right, WP offers more. However,
everybody compares text program using a check list with all the features.
the program that has most checks gets the award of being the besttext
program, while nobody cares, *HOW* the features are implemented.

Take for example the formula editor in WP (wic is even in th PC world
compared to the one in MS Word bad). While you can write formulas with it
and they o ppear as formulae, their quality is far frombeing comparable
to the PD program TEX. Using the add-on "Formula", which is available for
Atari wordprocessors, I have an output uality that is equivalent to that
of TEX (well, because it is based on TEX routine and fonts) while having
the comfort and ease of use of a graphical formula constructor. In terms
of ease of use it outperforms the one in WP briskly.

Third important point: Support; if I have problems with my Worprocesor or
any ideas for impovement I can call the company an talk to the *programmer*
directly; if it suits me, even for hours. No such thing as "hotline only
for 6 months then you have to pay" or hotline with people, who are
seldomly qualified to answer your questions. As a result, I can purchase
updates, for example, that have my ideas being built in and secondly, I

hardly have to change hardware to get an uodate/upgrade working. Consider for example the typical WP user. He started out with a text only program on a 286 (wasn't it those times wher WP users and programmers thoght tha WYSIWYG and a mouse are just toys that distract from working), with the later versions of Wordperfect for Windows he upgraded to a 386, now, with WP6, he needs at least a memory expansion, or even a 486 upgrade (well, a HD cannot be large enough, so a 1GB HD would bes suifficient). I can promise you that WP7 will even slow the machine down more, so a Pentium (aehhhh...when the bug is fixed) will be needed. Point is, working with newer versions seldomly becomes better in the PC world, and I know enough people who still stick to WP 5.1 for very objective and obvious reasons. As the program provides for everything you need,why should you change? Especially when you add features , you do not need, while the functions you need, slow down and you meed to invest money an time for the new version. At least, if one understands, that PC wordprocessors are mostly used in offices for one or two page letters etc. Write a document with 100 pages least, add a lot of graphics etc. and the system (WP) becomes barely usable.

Bottomline: years, after I have bought my Atari, I can work faster with it in textprocessing than any Pc wordprocessor, create better output than a PC wordprocessor and have even better support than with a PC company on a current PC. Papyrus and Temous Word do not take the "hit and run"-type programming philosophy to provide for s many nw features in little time, but when they implemt a feature, it is certainly worth looking on it. And people like me build a solid user base, who are willing to pay for such profound professional work, so they can make their future developments as carefully as their current products.

If you want to convince yourself, install MagicMac on Amcintosh machine (or buy a Janus card for yiour PC) and install Papyrus or Tempu Word. You'd love it. BTW, WP was available for Atari also (version 4.1); support was dropped, after so few people bought it.

Regards,

Alfred

> fast in truecolour mode though

The slow processing speed of picture-manipulation in 4-,16-, and 256
-colour modes derives from the fact that Atari-programs (Graphics) try
always to represent eg. JPEG-pictures in optimised form (=dithering,
palette-adjusting etc.). That's why truecolour-mode seems fast: there's
no palette and dithering processes.

Are you sure that "processing speed" slows down with increased colour
resolution, or is it just the slower displaying that makes it feel
slower? (I agree it is still a problem).

Right, the user interface is incredibly well designed. And this
is a point one should never underestimate (as well as program
stability, which also is excellent under papyrus). Just a huge
functionality doesn't make a good word processor - one must be
able to work with this tool efficiently, too.

Bye,

Chris

>reason why I use my Atari for writing long documents because there it is
>where you need speed every single second and it is of such importance
>that it is to label the most important of all features.

space is to some extent a non-issue since $/MB for disk is falling fast.
of course if the space for s/w is rising faster than constant cost
space, that is an issue. i don't think this is the case, however.

since i am considering a Falcon at the moment (my mega4 died and i am
using my 1985 vintage 1040 at the moment), this is interesting. i also
have a 486DX2-66 (and i just got WP 5.1 because of work). i know it is
slow (scrolling) compared to (say) MicroEMACS (on either ST or PC). in
fact i found that out 2 minutes after installing WP since my first task
was to print out a 300 page document (in about a dozen files).

what if found good about WP was that for my initial use, there was
essentially zero learning curve (ie, it was intuitive enough to never
crack open the manual beyond the install procedure). i also note that
i have not touched it beyond that initial use, mostly because the
document i had to print was in WP form, but the customer wanted the
response back in FoxPro format (which i have to assume does not exist
on the ST). note that i don't make the rules...

how does printing speed compare? i found a huge difference in print
speed between a 4 MB 486SX-33 portable and a 16 MB 486DX2-66 connected
to the same printer (QMS 410PS, a postscript laser). i brought my
portable to work to print a document on a laser and ended up taking the
printer home instead! i found probably 10x improvement (which i presume
is just because of the extra memory on my system at home).

how do the ST/TT/falcon wordprocessor fair when it comes to supporting
printers? i have had excellent luck with the PC (windows drivers in
general work well, without hassles). i have access to at least 5 printers
(HPLJIII, QMS postscript, Seiko color, HPDJ, etc).

>When it comes to features, you are right, WP offers more. However,
>everybody compares text program using a check list with all the features.
>the program that has most checks gets the award of being the besttext
>program, while nobody cares, *HOW* the features are implemented.

i do care. i never judge software based on check lists. speed is generally
more important with wordprocessing, at least for me (and for you as well,
it seems). i'll sacrifice (some) features for speed.

portability is also critical for me. i work in the unix world. there
troff and TeX are still the most prevelant document processing systems,
or at least the most portable LCD. and they do not require a mouse,
meaning i can dial in over a VT100 from home.

>Take for example the formula editor in WP (wic is even in th PC world
>compared to the one in MS Word bad). While you can write formulas with it
>and they o ppear as formulae, their quality is far frombeing comparable
>to the PD program TEX.

i don't think i'd use any wordprocessor for docs with lots of formulas.
LaTeX or even troff/eqn would be my first choice, depending on how portable
the doc has to be (which for work means either troff or MS Word). since
i have used troff for close to 10 years, needless to say i know it quite
well (including pic, grap, eqn, tbl, et al). i'll take typing over mousing
any day (since for me typing is much faster).

>Third important point: Support; if I have problems with my Worprocesor or
>any ideas for impovement I can call the company an talk to the *programmer*
>directly; if it suits me, even for hours.

ok. but a company that lets you talk to a programmer "even for hours"
is extremely rare, even in ST circles. but it is also good to funnel
comments/suggestions directly (unfiltered) to the source. also, if most
of the code written for the ST comes from europe, phone support would
not be much help for me anyway (i live in US). there are dozens of books
on WP to choose from as well. i presume tempus and papyrus come from
europe (germany?).

a small company with programmers doubling as tech support is sooner or
later going to run out of steam due to burnout. having done exactly this
in the past (programming/support and burning out), i know. consider
yourself lucky for now. i can't see this being the norm in the software
business.

>WP6, he needs at least a memory expansion, or even a 486 upgrade (well, a
>HD cannot be large enough, so a 1GB HD would bes suifficient).

WP also comes on CD-ROM. and yes, i know about s/w glut (having installed
several large windows program including quattro pro, persuasion, WP,
cakewalk, etc). i don't think you need 1 GB disk, however. i have used
about 150 MB out of 340 MB so far on my 486. the only s/w lacking on
my PC at this point is a general purpose database. i think 200 MB would
be more than adequate for most serious office-like use. at $0.50-1.00/MB,
that is not much cost for the serious user.

>At least, if one understands, that PC wordprocessors are mostly used in
>offices for one or two page letters etc. Write a document with 100 pages
>least, add a lot of graphics etc. and the system (WP) becomes barely usable.

so it sounds like for a high percentage of (PC) users, WP would be more
than adequate. for most (ST) users, it would also probably be adequate.

i agree that WP may not be adequate for people writing textbooks or long
papers with lots of equations. there are better tools (eg TeX).

i should also note that more and more organizations are exchanging docs
in electronic form. i write a lot of proposals. last year i received
exactly zero RFPs electronically. this year i have seen about half dozen.
and virtually all are either Word or WP (mandated by the customer). next
year i expect that half the RFPs i see will be electronic. this is
especially true with large companies (say fortune 50) and the US govt
and even some (public) universities.

which brings up another point: how readily will ST wordprocessors work
in the "real world", ie, where information needs to be exchanged with
PCs and Macs? can tempus and papyrus import/export docs with other
wordprocessors or is there a proprietary format? not just text, but
pictures (bitmaps, etc), graphs, equations, tables, etc. i have been
able to import Word docs into WP without much problem.

also, since i don't want to learn several programs, how closely do
the ST programs work compared to the PC? here i mean the user interface
(commands, function keys, etc).

how well does the ST world support full-page scanners and how good is
the OCR software? this is one area i am just getting into.

finally, solid CD-ROM support would need to be assumed. by solid i mean
foolproof, and generally integrated with a system. from what i see,
virtually every aspect of the ST world beyond the basic box comes
from third parties (not bad, but it requires the buyer to shop around
far more than you need to do in the PC/Mac world). a hobbyist might
relish this, but i really don't have the time for it. i will pay a
premium for someone else doing the integration. this is common in the
PC world (scores of sources to choose from) and is virtually non-existent
in the ST world from what i can see.

>If you want to convince yourself, install MagicMac on Amcintosh machine
>(or buy a Janus card for yiour PC) and install Papyrus or Tempu Word.
>You'd love it. BTW, WP was available for Atari also (version 4.1);
>support was dropped, after so few people bought it.

no thanx. i so rarely use any wordprocessing program that what i have is
adequate. for serious stuff, i run back to emacs/troff...

>Regards,
>
>Alfred

thanx for your insight. and thanx for no "i hate bill gates so anything on a PC is bad" arguments which seem to be the norm here... :-)

i doubt that a decision to buy falcon for me would rest on wordprocessing, but it is nice to know there seems to be an alternative. i would, however, need to be convinced that document exchange between atari and PC would be nearly transparent. like it or not, i have to deal with the PC/Mac world.

>these are standard on the Atari line already (only exception being keyboards
>& mice, off the top of my head) it makes sense to continue the trand.

> ~Chris
Yes, I argee with using industrial standard, and it will be easier to
replace or upgrade parts, like mon, mouse, ram.

But I think the previous person mentioned using a PC emulator to run IBM
softwawre in ATARI.

In that case, I think one better have both PC and ATARI.

Advantage is of course guaranteed speed and high compatiblity in running
windows, etc. And I think it is cheaper, since for the price of a Falcon
286speed, one can get a 386 4meg ram with a little more, but with higher
speed.

But the disadvantage is that one have to buy two sets of RAM and high disk.
Especially expensive, if you consider buying both machines with 16m ram.

```
Hw> anyone know if there are adjustment knobs to be found inside
Hw> the case?

There's a file around that explains how to open up the monitor case
and do some adjusting of a couple of "pots" to widen and highten the
picture on a SM124. Some say it will shorten the life of the monitor
and some say no. I've done the adjustment on a couple of monitors
and one lived forever and the other did die, from what, don't know.
For what its worth, the Field Manual for the SM 124 says to adjust
for the biggest display. So, if you're a gambler, I think the file
name is MONOFIX. If you can't find it, let me know and I'll upload
it to Puddle City. Can't help you on the 48 line question.

>code in it, may be Christian Grunenberg is the only
>person that could make it run fast...

Actually, at first you don't need to optimize it with assembly it being
quite radically optimized in the C source level (they halved the multipli-
cations needed in the DCT/inverse DCT phase between versions 4 and 5).

>So any thought any one...???

I've cross-compiled the IJG JPEGv5 software for my friend's STfm (M68000
compatible code) on my Amiga! We measured the speedup to be over 30%
between the new and old (v5/v4) versions of cjpeg and djpeg. Moreover,
the binaries seem to work well, so I'll release it tomorrow in a package
almost identical to the following listing [of jpegv5bin.lha for Amiga]:

```
PERMSSN UID GID SIZE RATIO STAMP NAME
---------------- ------- ------ ------------ --------------------
[generic] 52728 51.9% Oct 28 21:30 bin/cjpeg
[generic] 47972 54.1% Oct 29 13:18 bin/cjpeg.020881
[generic] 64328 53.3% Oct 28 21:35 bin/djpeg
[generic] 58908 55.3% Oct 29 13:16 bin/djpeg.020881
[generic] 4500 55.8% Oct 26 22:23 bin/rdjpgcom
[generic] 5716 52.3% Oct 26 22:24 bin/wrjpgcom
[generic] 1999 49.4% Sep 27 20:11 doc/change.log
[generic] 15048 50.9% Oct 25 19:44 doc/cjpeg.dvi

If that's the basic command line converter one then it uses a _lot_ of disk space while it's converting, a temporary file 3 or 4 times the size of the original or something like that.

5735. HELP: MultiTeX won't work with Mint1.12

Newsgroup: comp.sys.atari.st
Date: 1994-12-20 20:43:11 UTC
From: abro@amath.unizh.ch
Message-ID: <1994Dec20.204311.646@rzu-news.unizh.ch>
Source record: 174249

Hi Folks!

Mint1.12 is nice. MultiTeX is pretty good. - But now I'm very unhappy:
(Multi)-)TeX doesn't work correct under Mint1.12!

I've problems with the filesystem: TeX starts working correct, but when it
writes the result (.dvi or .log) the path is krippeled (e.g. "oputs/log"
for "/tex/outputs/test.log"); and so it returns an error!

The problem doesn't occur by using Mint1.04! - Conclusionaly I returned to
Mint 1.04 :-(Does anybody knows a solution?

Ciao, Arnt

lps.ttp (lps123.lzh at atari.archive.umich.edu) will play almost every kind of sound format out there. The .au playback doesn't sound all that great, at least on an ST, but you can always convert .au to .avr with the 525 program (525.lzh also at atari.archive.umich.edu).

Soundlab plays .wav files well, but doesn't play .au files. But, as I said, you can convert them to .avr or .wav or whatever with 525. Works for me.

Use MiNT-net and the SLIP driver, or ka9q and connect via SLIP. Both
are on atari.archive.umich.edu, and ka9q is probably easier to set up
(though I have no idea).

UGH! Incredibly underpowered for a "new" machine, but I guess you're
after ST-compatibility, eh?

> RAM: 5MB expandable to 36MB

Yuck. 0M RAM on the motherboard, at lest 4 SIMM slots; use the 72-pin
ones so you can upgrade one SIMM at a time. That gives you a minimum of
1M and a max of about 128M.

> Also built in speakers

Ugh. Put on RCA jacks, hook it into your stereo.

> CD-ROM Drive with Double speed.
> Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors

UGH! Separate, upgradable VRAM, 1M standard (for 1024x768x256)!

> Disk: Hight density

If we must have floppies...

> HD: 160MB

Gee, that's tiny... can you buy SCSI disks that small these days? Oh,
you were planning on crippling the machine with IDE? Can you get IDE
disks smaller than about 270M?

> Comm: Modem and Comm prog., STALKER 3 for example

Offer this as a +$100 option (or maybe +$200 for a 14.4k and software).

I have two or three versions (demo) of the Megatracker on my BBS. I believe
all of them are able to play the S3M files. At least thats what the doc says.
But since i havn't got my finger on a single S3M file yet, i can't say for
sure. Thats why i'm looking as well.

> Is there any other advantage to the Falcon over a Gemulator
> running on a 486DX2/66?

Apart from the fact that the Falcon has a 68030 and the GEMulator emulates a 68000, not a lot. In a decent graphic mode (800x600x16colour) the GEMulator and Falcon are very comparible in pure CPU speed. This is mainly due to the video card in the PC taking the strain whereas in a Falcon you need BlowUp or Screenblaster to get this res.

Of course when you need to use the DSP then the GEMulator just isn't going to help. If as you imply you just use the falcon as a fast ST, then the GEMulator should be fine for you.

Roland.

@CiX

BTW I've gone for the TT/PC combo as I think the Falcon is underpowered, and like you didn't need the Falcon specific hardware. No GEMulator test I've seen so far outpases the TT, but what with faster and faster Pentiums, its not going to be too long. OTOH its going to be one *expensive* PC!

I must admit I've had my PC a few weeks now - and I still use my TT more than it. I feel a lot happier for having the PC though. I don't feel trapped in a declining Atari market as I can get out any time I want to (and go back in any time I want to as well).

:-)

Actually, I'd like Atari to design a generic PowerPC PReP compliant computer
with PCI bus and put the Jaguar chipset on card. And license MacOS from
Apple. This *WILL* be the definitive personal computer, IMHO.

But of course the possibility of Atari actually doing this is just about
zilch.

>
>Have you take the latest version of MGif ?? (Version 4.2 i think)
>It's really fantastic !! It displays gif,jpeg pictures very good on
>mono monitors. You can ftp it, from hensa

Actually MGIF 4.2 has been available for about a year and a half. The
latest version, 4.4beta, is only available from my ftp site, rand.thn.htu.se,
for the time being. The archive is called /pub/mgif/mgif0927.lzh.
Please, do not make any MGIF 4.4beta files available anywhere else.

Although this is still a beta release (and almost three months old), it's
a _lot_ better and _much_ faster for many things than v4.2.
New features are among other things full colour support for all normal
ST/TT/Falcon modes, but not yet for graphics cards.
MGIF uses no flickering or palette switching for colour modes, so for 16
colour modes SoL, PhotoChrome or something like that will give better results.

The interface is currently being updated and I expect to make a full
release within a couple of weeks (but then I've expected that for more
than a year now... ;-).

The very latest MGIF version can be found in the same directory as above
under the name eero.lzh. This file does not include any documentation or
setup files and not everything is working 100%. If anyone would like to
try the new interface out anyway, please fetch it.

All comments, suggestions, bug reports etc are very welcome.

>printers? i have had excellent luck with the PC (windows drivers in
>general work well, without hassles). i have access to at least 5 printers
>(HPLJIII, QMS postscript, Seiko color, HPDJ, etc).

The printing speed (I have a HPLJ IIIP) varies a lot among programs,
Calamus SL prints a complicated 300 DPI -page in about 30 sec.,
some programs take 3-5 minutes for a 300DPI -page.
Tempus Junior prints a page in 2 minutes, Protext in few seconds (as it
uses HP's internal fonts). The printing speeds can be improved with
ACC-spoolers, and with program updates you usually get also faster
printer drivers.

HP-drivers are found in every Atari-program (nowadays also colour).

Usually, in Atari-world there's no postcript, but documents are printed
as bitmapped graphics-dump. It's slower, but it's real WYSIWYG.

>how well does the ST world support full-page scanners and how good is
>the OCR software? this is one area i am just getting into.

OCR 1.3 is a shareware program, it has font libraries (learn) with several
definitions for each letter, it can process slanted scans etc.
Great interface.

I have unearthed a lot of old Atari ST magazines at home. Various issues, but a lot of them, a lot of ST Actions and a some ST Formats and others too. In fact I think I have issues 1-30 of ST Action (don't know when the date was though, I'd guess 6 or 7 years ago now)

There's also a lot of coverdisks that go with the magazines that I still have, but I don't have an ST to try them on anymore, so you'd be taking your chances with these.

Would anyone be interested in buying these? I'm not talking anything expensive maybe just 50p a throw plus P&P. It depends, the 1st issue of ST Action might be worth something to someone who wants it? (Not likely but you never know)

Anyway, if you want a more concise list (Once I know if anyone is interested I'll find out exactly what is there) then e-mail me and I'll send you what I've got. If you respond to the newsgroups I'll try to mail you, but I may not get in here again for a while.

Scott.

5754. C-LAB Falcon Mk II/C-LAB

Newsgroup: comp.sys.atari.st
Date: 1994-12-21 13:23:33 UTC
From: m9003@abc.se
Message-ID: <3d9a8l$ih9@oden.abc.se>
Source record: 174153

This is a press-release from C-LAB dated November 15 1994 :

" C-LAB, Hamburg, responsible for the success of MIDI recording products such as Notator, Creator and Unitor, wich set a standard on the ATARI ST platform in the late 80's, has signed a worldwide license agreement with the Atari Corporation of Sunnyvale, California to manufacture, market and distribute audio workstation products based on the Atari Falcon030 platform into the Pro Audio and Musical Instrument markets.

C-LAB is authorized to enhance the Falcon030 hardware and software to meet the specific needs of these markets. C-LAB will handle sales, marketing, developer and customer support for the new products under this worldwide agreement.

C-LAB envisions this as the next generation of home recording products, a "One Stop Sollution" wich will work enrirely in the digital domain as a fullty accessable workbench for MIDI-/Realtime Hard Disk Recording and Editing at a very reasonable price. Building on the existing broad software base, C-LAB will work with developers to fully implement enhancements to the Falcon technology to the benefit of todays recording studio user.

The first in this line of products will ship in Januari !995, Named C-LAB Falcon Mk II, it will be a look-alike of the well-known Atari Falcon030 with some additional improvements for use in the musical instrument and pro audio fields. Improvements in the internal audio as well as adequate memory and SCSI hard drive capacity as standard will be the first major additions.

Further additions, such as an enhanced desktop and a 19' -rackmount version designed for the professional audio market will follow by mid 1995."

So what about the PPC? It has to be done officialy by Atari to port PPC
into atari platform otherwise there wont be intresting for programmers
and customers because of lack of any standards and applications. And the
68060 is enough backward compatibile and enough powerful to satisfy all
the atarian (I meen F030'an).

regards,

Simon.

> Think about it, would you by it?

Definitely not. Essentially, you're describing a TT with a few more
colours. I don't think I'd buy a machine with built-in speakers
for pretty much the same reason I would never buy a machine
which has a combined housing for both the mainboard and the
monitor. In general, the machine you're describing is a
mainstream machine without any spectacular features whatsoever,
and it isn't even cheaper than equivalent clones!

To establish a new computer on the market, you need really
innovative features in order to get hold of a niche market
first and expand from there. In that sense, the Falcon was a
good machine, but too late and with too many compromises.

I think it's much easier to add a decent Midi port to a Mac than
to try to port MacOS to a different, completely new 680xx platform
(which, by the way, would lead nowhere since Motorola pushes the
PowerPC and nothing else). Oh, and by the way, I don't buy the part
about TOS being a more stable and capable OS than the MacOS. Faster
maybe, if you're talking about MagiC.

> How can we carry the Atari computer to the future. The Atari computer
> has left a major dent in the music industry.

I have not seen MagiCMac yet, but if it lives up to the expectations
that you can have if you know who programmed it, it will provide
a feasible upgrade path, protecing your software investments. What
more can you possibly want?

I guess my point was that IDE vs SCSI is just as much a personal preference as
Mac vs PC vs Atari, so we can throw around "REAL computers use..." as much as
possible and not get anywhere. So, we seem to agree :)

>:
[...]
>: CD-ROM Drive with Double speed.
>
>why not quadrupple (or at least triple)?

Because triple and quadruple speed CD-ROM drives are mostly marketing
hype, that's why. Even the well-built NEC units are only as fast as
good double-speed drives from Sony and Matsushita in real-world use.
Definitely NOT worth the exorbitant prices they currently command, IMHO.

>(BTW you can buy a machine with a 486DX2/66Mhz instead of the 68030, with
>all specification I gave, for 1800NLG = US$1000)

Geez... how often do we have to hear this argument? The point is, MANY
of us don't WANT a peecee at ANY price. I've been there, done that, and
bought the t-shirt, gang, and I do NOT want to visit that nightmare again!

Tell you what... I'll reconsider a PC only when (and if) the time -ever-
comes that *ALL* PC's and their OS's are built such that the user:

- NEVER has to concern himself with the likes of config.sys,
autoexec.bat, win.ini, dos.crap, etc, etc;
- NEVER has to worry about the need to reconfigure the entire system
because he 'dared' to try to install new or remove old software;
- NEVER has to worry about IRQ's and interrupts when installing
something as simple as a sound or video card;
- NEVER has to worry about an application exceeding 640K of his
primary RAM even though he has 16Mb of physical RAM installed;
- NEVER has to worry about support because the manufacturer or his
low ball machine went out of business after 6 weeks;
- can actually unpack the machine, turn it on, and have it work!
(my, what an amazing concept, eh?)

Yeh, I'm being quite a bit facetious here, but the point is that a low
purchase price, while important, is NOT the whole picture. Of equal or
greater importance is it's ease of use, reliability, and the degree of
productivity enhancment -after- you get it home and your check clears.

The Atari ST/TT/Falcon genre are such machines. Now that Macintosh
prices and performance are realistic, they are now in this group, too.

PC clones may be cheap, but have a looooong way to go in the other areas.

All IMHO, of course. Your mileage may differ. :)

Exactly. :)

>Ugh. Put on RCA jacks, hook it into your stereo.

A decent built-in speaker would not be too bad for blurps & whistles.
RCA jacks would be in addition.

>> CD-ROM Drive with Double speed.
>> Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors

>UGH! Separate, upgradable VRAM, 1M standard (for 1024x768x256)!
Good idea, but highly incompatable with scrolling, etc. probably. I say leave the programmable vid hardware of the Falcon, and let it use up to the first 4 megs of memory, similarly to the TT, but programmable modes, so we can have up really anything limited only by the bandwidth (which should be much higher than the current falcon for video work, or somewhat higher for standard apps)

>> Disk: Hight density

>If we must have floppies...

We must.

>Gee, that's tiny... can you buy SCSI disks that small these days? Oh,

The new Falcon will definitely be marketed mainly for musicians, and there
the Falcon is a better solution as a home-studio than PPC:

Here I quote Article 25627 of comp.music (without permission :-))

From: bdenckla@course3.harvard.edu (Benjamin Denckla)

[a lot of descriptions of the sound systems of older Macs deleted]

"The big question in my mind ever since the Power Macs were
announced was whether they would be able to provide realtime DSP
functionality similar to that of the 68K AVs. At present the answer is
unknown to me. The two Apple documents relevant to this issue, Macintosh
Developer Note Number 8 and Power Macintosh System Software, make no
reference to DSP programming. An advantage to doing DSP on a Power Mac
would be that one could choose to write DSP code in C or assembler depending
on how much speed was needed. Also, only one development platform would
be needed: no expensive DSP compiler or assembler would be necessary since
all code would be PowerPC code. On the down side, it remains to be seen
whether the PowerPC chip offers the same DSP performance as the 3210. In
addition, the design of the 68K AVs is quite elegant in that it moves DSP
tasks off the host processor so that \normalo processing tasks and
background DSP processes do not compete for clock cycles as they would on
a Power Mac.
Some brilliant system software and hardware design went into the
68K AVs, and as a result they provide unique audio DSP possibilities for
programmers like myself. Though they are no longer produced, they have a
fairly wide installed base so that programs written for them could reach a
wide range of users. The Spectral boards provide a viable substitute for
the 68K AVs, and have the advantage of digital audio interfacing. The
Power Macs have the same digital audio hardware as the 68K AVs, but they
lack the 3210 chip and it is not clear whether the PowerPC chip can take

its place.

Hi!

I'm having troubles with ka9q/nos (NOS.TTP):
maybe it sounds trivial, but I don't know
how to start (make a script file)..
When I start this NOS.TTP prompt "NET>"
appears. In included docfile says that
I must type a script file (I've done that
part), and put the name of that script file
as parameter when starting NOS.TTP .
Yes, but NOS.TTP do not accept the orders
from the script file ..
(I've type the script file all 'by the book'-
just like stands in the doc)..
Can anyone help me, please ?

Many thanks,
Neven

5776. ST stuff for sale or trade and wish list

Newsgroup: comp.sys.atari.st
Date: 1994-12-21 21:37:57 UTC
From: nicole@seas.smu.edu
Message-ID: <1994Dec21.213757.11982@seas.smu.edu>
Source record: 174327

I want some Atari ST stuff, and I also have some stuff to sell or
trade.

First, the Atari ST stuff I have to sell or trade :

1 @ 520ST (no f, no fm, no e, just plain old un-upgraded 520st) with
separate power supply brick. All in working order.

2 @ SF354 single-sided 360K disk drives with 2 power supply bricks
All in working order EXCEPT THAT some of the disks written by one
of these drives can't be properly read by my newer double-sided
drives, though they all seem to be readable and writeable on
both single-sided drives. Between themselves I've never had any
problem; only when using other drives.

1 @ Atari 1224 color monitor with knobs on side: works fine.

1 @ Atari 1224 color monitor with knobs on side: works intermittently
or not at all; i.e. when it comes on, it works fine, but when it
doesn't come on, it doesn't work at all. I never could figure it
out, but I didn't try very hard.

4 @ 256k simms, worked fine when recently removed from 1040STe during
upgrade

1 @ seagate ST-238R PR hard drive removed from atari megafile30.
Boots and runs fine every time I turned it on for about an
hour, then balks. I figured it was the motor overheating, but
I found a replacement RLL drive for free, so I never investigated
further.

1 @ IB 5-1/4 inch drive for the AtariST. It came with a used system I
bought. He said it works; I've never tried it. Also PC Ditto
software 1987 vintage unless former owner had it updated
somehow without a new disk (says 1987 on disk).

1 @ Atari/TDK DS/DD 720K drive removed from 1040STf--spins but has
other read/write problems with some sectors of most disks.

1 @ Alps DS/DD 720K disk drive whose only known problems are the
drive-setting switch, which I bypassed by jumper-wires and a
intermittent problem affecting some sectors which I believe is
a cracked bit of flat and flexible copper-traced cable running
from the head to the circuit board.

1 @ st keyboard (C070597-013 stamped on it) with l.e.d. for internal disk
drive. Plastic part with all keys intact. circuitboard with
electronic parts all intact. As to the 1/2-eyeball-type rubber

contact switches, they are in a plastic tubexcept the I took one for
the keyboard on which I'm typing--I believe I kept up with all the
eyeball things but that one. As you know, when those eyeball
things get a gob of stuff on them, you lose a key, and when you
open the keyboard for the first time to see what the trouble
is, they all drop out, and one or more may be eaten by passing pets.
When the Atari shop guy threw me the keyboard in this listing, it
included a post-it note that says, "Bad space-C/L-Rshft Z, X".
Sounds like dirty eyeballs to me, but I'd really only reccomend
this keyboard for parts.

Now, What I know of that I'd consider in trade/buying outright, but
I'm also open to other suggestions, especially for trade of the above
stuff:

ICD scsi drive stuff--the host adapter preferably with the clock
or the link
the software (along with the above)
scsi drive (along with the above)
CD drive (along with the above)

working st compatible joysticks

Atariworks

inkjet printer

a spellchecker program or acc. that lets me use ascii wordlists
(including high ascii characters of Spanish and French) for
dictionaries without entering them one word at a time.

Worksheet for VIP (lotus clone) or OPUS (shareware which I'm considering)
that'll work for checkbook balancing/mom&popbusiness bookkeeping
(checkbook with say 50 expense categories and 4 or 5
income/deposit categories should suffice).

(I've been using I think it's a Haba checkbook balancing program but
I need something different.) NOTE: This is also what I'm
considering Atariworks for, and I might consider some other
software, but only if I don't have to create my own spreadsheet

Nope.

On a FALCON IDE _is_ faster than SCSI using the same type of drives. Falcon SCSI can handle up to 1.8 megs/second whereas Falcon-IDE can handle up to 2.2 megs/second. The SCSI-DMA-chip is the problem in this case.

Is the emuation really that fast? IIRC, the emulator does 020-emulation,
doesn't it?

>Of course, as nice as it would be, I'm not -really- holding my breath for
>Atari or CLab to do this anytime soon, are you? ;-)

Neiter do I ;-)

How many people do actually work for CLab ATM. IIRC all their programmers ran
away and started over a EMagic. Are CLab capable of developing _anything_ at
all?

Hi,
The colour monitor for my ST just died. I've a normal SVGA
monitor to spare so is it possible to connect it to the ST to use it
either as a mono or colour? If yes does anyone has the diagram for the
wirings?

TIA.

From: mayolc@ucunix.san.uc.edu
Message-ID: <3dahc6$7id@ucunix.san.uc.edu>
Source record: 174329

What is my point? Hutch mentioned. You can get something reasonable priced on other platforms. The machine I just described [I am not saying that this is the most powerful machine, I am not into my gun is bigger than yours], what I am saying is that an ATARI like this will be very, very expensive.

I am in the market for a TT030, and quite frankly I can not justify the buy, with its way too high price. What happened to POWER without PRICE. I think is time for ATARI to lower TT030 prices if they want to compete. You simply get too much in the other side for much less money. I know several users who have change platform, not because they didn't like ATARI, but because ATARI decent machines are too expensive.

My point: P R I C E A W A R N E S S !!!

Message-ID: <1994Dec22.004308.11258@scorch.hna.com.au>
Source record: 174159

Hello There!

I am thinking about getting Notator SL for my 1040STE. The problem is, it only runs in high res, doesn't it? And I only have a colour monitor. I don't really want to buy a monitor as well, and atari hard ware is getting near impossible to buy here in Australia. Is there a desk accessory which I can use to emulate high-res, and if there is a shareware/freeware version, could someone please post it to me? I cannot ftp.

Lots of questions. I hope that they aren't to frequently asked.

Thanks very much in advance.

- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....

- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

- -

In <1994Dec20.095625.24816@jet.uk> Dennis Armstrong wrote:

>Definitly no ide drives, the performance of them is not good, and cost

Not true for the Falcon. IDE is a little faster than SCSI.

>wise the SCSI drives are the same price. Newer PCs have a SCSI chip on

Prices here in Germany are _about_ the same. With a slight advantage for IDE.

>the mother board. SCSI is the direction the PC is going.

Not true. Ever heard of ENHANCED-IDE?

That's the way the consumer-pc's are going to be fitted with. Most modern
boards have the option of shipping with the SCSI-chip installed. Often they
don't. SCSI is more expensive and you need a BIOS capable of using the
SCSI-chip.

Although I still do believe SCSI is the way to go ;-)

```
: Who cares when it doesn't even work on the Falcon. Skip Magic, and go back
: to the Tos insted. At least untill they do a Falcon version, which is working
: with all software as well as Calamus.

Yeah, well when ST Review/Format & User all say it is wow, fantastic blah
blah, blah, it comes quite a shock not to mention a dissapointment that
the program in question turns out to be a Total Lemon!!!!!!

God knows what it will be like on a MAC....

5798. Atari Disks to read on anything else?

Newsgroup: comp.sys.atari.st
Date: 1994-12-22 13:24:12 UTC
From: scott@cocacola.whoi.edu
Message-ID: <3dbuls$5jj@cocacola.whoi.edu>
Source record: 174161

Someone here has some Atari ST disks that contain a number of basic programs that he wishes to put onto his SGI -- trouble is that his Atari has all but died and he needs a way of getting at the data.

Is there any sort of a program for PC's or Macs which will allow them to read an Atari disk?

Any advice appreciated!

Scott

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/12/94
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

2nd Update
~~~ ~~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

News and Changes
~~~~ ~~~ ~~~~~~~

Well since the original description a lot has happened. I'm now involved in
several projects, and submit work to several Internet and diskmag sources for
inclusion. I have also officially took over the maintenance of the Atari FTP
list from Hallvard Tangeraas of which there have been a couple of updates.

New items in this document since the last copy will be marked with **. All new
items are also listed below according to the date they were added.
```

The new items this month are:

22/12/94 -- Lynx Tips and Tricks
22/12/94 -- Ultra Vortex FAQ update for Jaguar
20/12/94 -- Lemmings Review for Lynx
20/12/94 -- Lynx Casino Review for Lynx
19/12/94 -- AEO Newsletter Volume 3. Issue.14 in text and ZIP format
12/12/94 -- Atari FTP List Update
12/12/94 -- Falcon Specifications and Information
12/12/94 -- Edith Professional Review by Frank Charlton
8/12/94 -- Falcon Owners Group Magazine No.7.
8/12/94 -- Newsletter format changed
8/12/94 -- AEO Newsletter Volume 3. Issue.13 in text and ZIP format
8/12/94 -- Questions and Answers pages updated, question 14.
6/12/94 -- Questions and Answers pages updated, questions 12 and 13.
6/12/94 -- CAIN Newsletter Volume 1. No.8
5/12/94 -- Got Doom on the Jaguar, expect a review soon.
2/12/94 -- Hand Made Software News (Jaguar)
2/12/94 -- Lynx FAQ updated
2/12/94 -- Jaquar FAQ updated
2/12/94 -- HENSA Atari TOS Newsletter Volume 7. No.11
28/11/94 -- Sensible Soccer News for Jaguar
25/11/94 -- MiNTNet FAQ
25/11/94 -- HENSA Atari TOS Newsletter Volume 7. No.10
24/11/94 -- Sinister Developments News (Jaguar)
24/11/94 -- Coming Soon! (Jaguar)
24/11/94 -- Rebellion Development News (Now in HTML)
24/11/94 -- Klax Review for Lynx
24/11/94 -- Kung Food Review for Lynx
23/11/94 -- A.9 added to Questions and Answers page.
23/11/94 -- Rebellion Development News

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to

grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:
~~~~~

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.
**MiNTNet FAQ by Christer Gustavsson. Everything you wanted to know about **MiNTNet.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them. These have been re-organised to make it easier to keep track of. At the moment there is:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.
**AEO Newsletter containing the latest Atari news.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)
**Edith Professional review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.
~~~~~~~

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.
**Falcon Specifications and Information compiled by Rod McCall.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.
**FOG issue 7 diskmagazine for Falcon.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).
- FOG issue 6 diskmagazine for Falcon.

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:
~~~

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

New reviews are:

Klax Kungfood Lemmings
Lynx Casino

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:
~~~~~

- Lynx FAQ
**Lynx Tips and Tricks

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar.

**Rebellion Development News
**Sinister Developments News
**Sensible Soccer News
**Coming Soon!
**Hand Made Software News

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
**Ultra Vortex FAQ update for Jaguar

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.
~~~~

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials. Also Claus J. Pedersen (Stello author), Bob Brodie (former Atari employee) and Steven Davies have all offered to support these pages with contributions in the future.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

5800. SLIP connection for ST

Newsgroup: comp.sys.atari.st
Date: 1994-12-22 13:54:43 UTC
From: burch@sa.rl.ac.uk
Message-ID: <3dc0f3$11og@unixfe.rl.ac.uk>
Source record: 174162

Does anyone know where some PD software can be obtained to effect a SLIP connection for the ST?

Thanks

Pete

5801. PD computing languages?

Newsgroup: comp.sys.atari.st
Date: 1994-12-22 13:56:37 UTC
From: fraser@sydney.DIALix.oz.au
Message-ID: <3dc0ilrqh1@sydney.DIALix.oz.au>
Source record: 174163

Hello atari users everywhere!

I was wondering if there are any Public Domain computing languages
availible for the Atari1040ST.

Atari support ain't that good in the land of the long hot summer.....

I guess what I'm looking for is something with a compiler.

If you do know of any sites which hold such software please email me at:

fraser@sydney.dialix.oz.au

>Is the emuation really that fast? IIRC, the emulator does 020-emulation,
>doesn't it?

Don't know anything at all about IIRC. My comment was based on personal experience with a PowerMac 7100/66 (at my office) and a Quadra 660av (at home). The PM's 680x0 emulation is nearly the same speed as my 040-based Quadra which has been boosted to 32MHz. The PM's emulation would be a lot slower than a 40MHz 040 and a bit slower than a 33MHz 040 but it's decent. I can only assume that a PPC-based Falcon could see the same performance.

>How many people do actually work for CLab ATM. IIRC all their programmers ran
>away and started over a EMagic. Are CLab capable of developing _anything_ at
>all?

Many have assumed that CLab is going to jump into the manufacturing business in a big way and I just don't see how they could with their current staff (don't know the exact number but I'm told very small). They are a lot smaller organization than Atari and you know what kind of trouble we had with THEM. :)

But hey, I wish them great success in any event.

Well, I am finally going to replace my flaky 20 Meg harddrive with a newer more reliable one (hopefully). But I have the following questions and request.

I probably will be picking up a Maxtor drive in the 200-500 Meg range, but I don't know what the max size of a drive should be, I know about partitioning, but don't know to what extend this doesn't get detrimental to the operation of the computer. I also would like to know what access speeds the mega2st can handle from the various drives.

I know, that for the Link to work, Parity should be disabled, but what else do I have to worry about?

When I purchased the computer system, I received the Harddrive and the link for free, but I did not get any of the Link software. So I will need to get the software from ICD. I need their address and phone # so that I can contact them.

If I can't get the software at a decent price, I will probably just purchase the Link II, does anybody have the specs on the Link II so that I can look at them, or know any problems that I may encounter with my current system {Mega2ST}? I remember about two three months ago seeing information on the Link, does anybody still have it around?

Any help would be greatly appreciated, thanks.

5810. SCSI for my 1040ST - how???

Newsgroup: comp.sys.atari.st
Date: 1994-12-22 20:30:42 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELXHCGWSUp@stingray.manawatu.gen.nz>
Source record: 174177
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

What would the easiest way to use a SCSI drive on my 1040STfm be?

I know there are ICD et al. adaptors out there - but I don't know which is the best for what I want - I don't need a lot - I just want to be able to run a 540Meg SCSI drive from it.

I don't want to pay a lot for it, as looking at an early 94 ST Mag from the UK, most of the adaptors are almost the same cost as the drive.

Could you please tell me the prices for them? I have a UK model ST if that's any help.

Also, what would I need to buy with the drive to get it all setup? I presume a case and a fan - that's no problem though - but do I need a power supply, or can it get power from the ST or the SCSI adaptor? And do I need to buy a cable aswell, as these companies always seem to charge extra.

I'd really appreciate any help you guys could give me, also perhaps the address of the best place to buy one. I don't mind buying from the USA, if the mains voltage is not of concern, as we use 230V 50Hz (like _most_ of the world). But Europe would probably be the easiest (providing they either speak French or English).

Thanks,
Richard =8-]

PS. Have a great Christmas all =8-]

IMO this should be

setenv DESKCOPY=D:\TOOLS\DESK_KBD2.PRG

When I install it like this, filecopying works great but file deleting not
(it seems this is going through Kobold also). When I select a folder and
drag it to the trashcan, nothing happens. When I select all files within
this folder and drag them to the trashcan, the files are deleted, but
whatever I try, I can't delete the folder...

h > offline reader, reading all my new email online, and offline I
h > would just reply to what I re-read from the capture buffer.
h > Can I do this as well in Connect?

In Connect you have two ways for capture:

The first is in the menu "setup" : Capture
You just have to enter path and filename in the field, choose exact or ASCII capture and activate "Capture active".
And now all is recieved in your terminal window is saved in a file until you go again in Setup/Capture and disable "Capture active".

This is the best way, I think, to save your Email (the really best way is a reader off line, but this supposes that the host server can send you QWK format).

The second way is very useful: you can define a block in the window with the mouse. If you press the right button before releasing the left button, a pop up will appear and let you save or append in the clipboard or in a file (then the fileselector appears), or print, quote, etc.

I hope this answers to your question. Try the two functions.

I think you have a non registered version of Connect (with test limited in time). You have the help on line, but it doesn't explain all the functions of Connect. If you choose to register (60 DM), you'll recieve an english manual which explains that and many other things.
I've registered to Connect and use it daily. I'm glad for my choice and think that Connect is the best terminal soft I ever used.

No, not until January/February. If someone could come up with an
interface to use it on an ST/TT/Falcon, though, it would be a very
welcome addition at only $149.95!

*** CREATOR SL 64 TRACK MIDI SEQUENCER PROGRAM FOR SALE ***

* One of the best (some say _the_ best) sequencers for the Atari ST or any other platform.
* Fully supported by Emagic (I own Notator and just got the latest ugrade disks free of charge).
* Upgrade path available from Emagic for Notator SL (scoring capability) or for use with Falcon (Notator Logic - which also runs on the ST). Cost to upgrade to Notator Logic is only $144 USD. The cost of Notator Logic _new_ is $500-something. You could buy this copy, upgrade, and save $231!
* Up to 64 MIDI tracks with ultra-high 1/1260 ppqn tick rate.
* Comes with original disks/manual/copylock dongle, all in perfect condition.

Q: If this program is so $#@! good, why am I selling it?
A: Because I _already_ own Notator! This copy came from the original owner as part of a package deal - I don't need _two_ copies. ;)

Q: How much is it?
A: Only $125 USD for what was over a $500 program!

From: tdonovan@red.seas.upenn.edu
Message-ID: <3de0vs$1qt@netnews.upenn.edu>
Source record: 174195

We inherited a Mega 4ST with a transcoder to convert its output to standard NTSC video, we would like to use it for a Video Bulletin Board type of situation, basically it sits there playing back graphics endless like what you would see on a public access channel etc. Does anyone out there know of a good program for this machine that looks good and is simple to use. We have been using Cyberpaint, but alas its for real graphics, not a bulletin board and is quite cumbersome to use for simple text screens.

I'm looking for specific program titles or vendors with whom to look.

Thanks,
*Todd

Unh...there is an English version of the MagicMac FAQ available. IMHO it
runs on the MacOS' BIOS routines. Should be quite slow, indeed.

> Also I realise that Mac's are cheaper than a Medusa, the T40
>retails for 3,400 U$D. However what about speed? I.e. an equivalent Mac040
>would it be faster or slower than the Medusa?

The Medusa has the main advantage that it is available, that's it. The
price has to fall when there are other 040 machines available.

One thing I don't get: the Eagle was announced to ship without DMA sound
capabilities, and the DSP board for it was planned incompatible ("better")
to the Falcon. If I remember correctly, this attitude has changed, and
GE-Soft will, if they do, ship a Falcon compatible sound/DSP board.

And we'll see what comes next. Atari publishing the TOS sources, Magic for
PowerPC? Seems our software will run on up-to-date hardware for some more
years.

: Who cares when it doesn't even work on the Falcon. Skip Magic, and go back
: to the Tos insted. At least untill they do a Falcon version, which is working
: with all software as well as Calamus.

First point, there is apparently a patch for Calamus called
Calapat.tos that will allow Calamus to work with Magic.

Secondly I could say "Who cares about a Falcon?". Magic for the
Falcon is being worked on, and if you still don't want to use it when
it comes out don't. But don't rubbish something just because the
present (And also FIRST) incarnation of it does not work on your
Falcon, or for that matter has a few compatibility problems (for
most of which there are fixes). Nothing works completely bug free
first time round (Look at the TOS version list), so if you cannot
get patches for your programs at present, wait for the next release!

>Is sampling on a Falcon as easy as plugging in the source thru the RCA in
>ports and then running some program to sample sound?

Yes. But if you need RCA, you'll have to do 5 minutes of soldering (which
I heartily recommend, as the miniplugs were really bad).

Get eg. Winrec and Mjuzakk, and you don't even have to pay for the software.

>I figure it should be, but am also familiar with Ataris *grin* and so know
>that nothing is obtained easily on one.

Right. That is why C-lab is going to fix all Falcon's low quality audio
parts....

And Happy Christmas!

5826. *New Atari Computer Platform idea*

Newsgroup: comp.sys.atari.st
Date: 1994-12-23 09:55:06 UTC
From: Kevin Dolorico <dolorick@acf2.NYU.EDU>
Message-ID: <Pine.ULT.3.91.941223043600.25164J-100000@acf2.NYU.EDU>
Source record: 174176

I was looking at the current computer situation in the world right now
and all I saw really was Apple and "Intel"...and Microsoft. Apple, had
been in the process of dying(until the the recent Pentium fiasco---now
they have a chance to dig into the market again!)

I heard that in the next few years, there is going to be ONE OS running
on all machines... a "standard"... This got me frightened! Are people
going to be whitewashed and see everything in one color? It might be true!

So... I have a suggestion for computer designers/hackers/or even ATARI...
Why doesn't Atari make a computer based around... THE JAGUAR's chipset?

Given its specs, I'd say that if you added more ram(8 megs+), it would
have more firepower than the current computer offerings. Port over a
version of Unix, and then you're rolling...

I'm sure there are people out there that are SICK of seeing "Intel
Inside" and "PowerPC" logos... they want something more along the lines
of a cheap SGI... Perhaps there could be a market for such a machine.
Given Atari's current financial problems just trying to market the
Jaguar(poorly, as it seems)... perhaps it would be within their best
interests to license off the design to some company to DEVELOP this
Jaguar-Based RISC computer.

What do they have to lose? It certainly wouldn't hurt them...

And just so I don't seem like an Atari fanatic---why doesn't Sega do this
either with their new Saturn-based technology?

This is just a thought.
Feel free to reply.

WANTED: Dealers to sell at Upcoming Swap Meets. Dealerships sought fall into such Categories as Computer Dealers, all kinds. All kinds of Computer HardWare, SoftWare, Peripherals & Accessories for ALL Computer Makes and Types.

Also Sought are Dealers in Video Gaming Equipment, such as Video Game Consoles, Cartidges, Video Game CD Players and Video Game CDs. ALL Video Game Makes and Types. ALL Video Game Consoles, Cartridges, CDs, Peripherals & Accessories.

Also Wanted are Dealers in ALL Types of Electronics.

WANTED are Dealers in Ham Radio, CB Radio, Music CDs and other Recorded Music. Stereo Equipment also Wanted.

Also Wanted are VCR's, Video Tapes (NO PIRATED MEDIA OF ANY KIND, PLEASE!!), TVs and Satelite Gear.

This is an ALL Computers, Game Machine and Electronics Swap Meet!!

Small Businesses, and all Dealers Welcome and Wanted!!

NO PIRATED ITEMS PLEASE!! NO PIRATED ITEMS PLEASE!! NO PIRATED ITEMS PLEASE!!

NO ADMISSION CHARGE!!! PLENTY OF FREE PARKING!!! NO ADMISSION CHARGE!!!

TABLES $10!! FIRST COME FIRST SERVE!! TABLES $10!! FIRST COME FIRST SERVE!!

Swap Meet Location in Portland, Oregon. USA. At 1819 N.W. Everett St. at the NorthWest Service Center On the First Monday of each Month.

To find out about more about the Swap Meet or Table Rentals.
Reply in E-Mail to bensmith@teleport.com.
Or Call Ben Anytime at (503)256-9974 (VOICE/VOICE MESSAGING).

Please Do NOT Reply in the Public Message Bases as I don't Read most of these Message Bases and the ones I do read I don't read regularly. The Best way to reach me is E-Mail or the Above Phone number.

The Next SwapMeet is Monday, January 2nd. 1995.

Your invited.

...message from Christopher Taylor to ilmen.lanl.gov :

CT> I guess my point was that IDE vs SCSI is just as much a personal
CT> preference as Mac vs PC vs Atari, so we can throw around "REAL
CT> computers use..."

It's not personal preference. If I remember correctly, in the Ataris SCSI is a DMA device whereas data transfer to IDE devices is done via PIO...

Polled I/O transfers severely hog up the main processor, so SCSI is definitely the better chioce on an Atari.

And nowaday, as SCSI gets more wide spread in the PC sector (thanks to cheap PCI SCSI controllers), SCSI HDDs cost quite the same as IDE (at least over here in germoney).

>going to be whitewashed and see everything in one color? It might be true!

It is sad and good at the same time. Plus it will not happen. Why?
Well, the good part is that whatever system you buy, you'll have software.
The bad part is that it'll probably be some dos-windows bastard child
that will require 32 megs just to boot. Also it will not happen since
the pc market is to fragmented. (when I say pc I mean peecee)

>
>So... I have a suggestion for computer designers/hackers/or even ATARI...
>Why doesn't Atari make a computer based around... THE JAGUAR's chipset?

This has been said before. its not a good idea. by the time programs
come out for it, it will be out dated. its best to base a computer
around a good cpu/motherboard/memory setup and allow graphics to be
upgradable. Thats why the IBM PC, a pitiful computer even any atari 800
could beat up, ended up to be the standard.

>
>Given its specs, I'd say that if you added more ram(8 megs+), it would

Two words.."unix? yuck!"

>I'm sure there are people out there that are SICK of seeing "Intel
>Inside" and "PowerPC" logos... they want something more along the lines
>of a cheap SGI... Perhaps there could be a market for such a machine.

I'm not sure of that. They just keep selling more. Me personally i'll never
buy another intel chip again (my 386 has a bug in multiplication and the
pentium that I almost bough can't divide correctly)
As for an SGI, the public will never buy a unix machine in mass numbers.

>Given Atari's current financial problems just trying to market the
>Jaguar(poorly, as it seems)... perhaps it would be within their best
>interests to license off the design to some company to DEVELOP this
>Jaguar-Based RISC computer.
>
Interesting point, why doesn't atari allow another copany that makes tos
clones to make the "next" atari computer and make some spending cash in
the process.

>What do they have to lose? It certainly wouldn't hurt them...

Tramiel would have to admit that they screwed up and that will never happen.

>
>And just so I don't seem like an Atari fanatic---why doesn't Sega do this
>either with their new Saturn-based technology?

I think sega did make an msx computer at one time..

From: hopper_t@msupa.pa.msu.edu
Message-ID: <3dei3r$c1e@msunews.cl.msu.edu>
Source record: 174188

Hi! I'm looking for a program that will fill in the desktop with either a fill pattern or a picture. The less memory and CPU time it requires the better. Needs to run on TOS 2.06 with NVDI 3. If you're familiar with Warp9's fill feature, that's the sort of thing I'm looking for.

Email replies welcome at t.hopper@genie.geis.com (note that address is different than the one I'm posting from!).

Thanks,

Tom Hopper

> Like the subject says.... lately my slm605 has been having problems
> printing on a specific portion of he page. There is an approximate
> 1/8th inch line that runs up the page, especially over dark print.

When I had similar problems with my SLM804, I got the advice from a friend to go to the pharmacy and buy a little bit of talcum (the price should be some cents, if s/he takes money at all for that). Then fill the talcum into a salt shaker or something similar and scatter some bits of it over the (green) drum (sorry for the English, I had to take some words from my dictionary, but hopefully they make some sense to you).

This procedure is similar to the packaging of a new drum unit, where there is also some talcum on the drum. This talcum smoothes the gum lip that removes the surplus toner from the drum. On the other side, just as I'm writing this, I think this procedure removes only some *black* stripes ("dirt") that appear after some years of usage. At least this procedure solved my problems and I had a much better printout afterwards.

Concerning the white stripes: if there is still enough toner and you already did shake the toner unit a little bit (in most cases, a bit of knocking on the toner unit is enough, or perhaps lift it some millimeters and push it down again), perhaps your drum is too old? I seem to remember that I had white stripes in that case, too, that were gone when I had bought a new drum.

5839. 1040, Supra 20meg HD, etc for sale or trade for 386

Newsgroup: comp.sys.atari.st
Date: 1994-12-23 14:05:07 UTC
From: charles@eskimo.com
Message-ID: <D19oGn.12L@eskimo.com>
Source record: 174190

I have a the following Atari computer equipment for sale or trade:

1040 ST - 1 meg, mouse, etc. No monitor $100

Supra 20 meg HD. Shoebox case. HA, PS, etc.
Works flawlessly. $100

Vidi-ST video digitizer. 8 shades,
320x200 @ 8 frames a second. This has been
my all time most favorite toy on the ST. $60

ComputerEyes full color video digitizer $40

ST Replay Audio Digitizer $30

I am looking to trade for a 386. Don't need a monitor or HD. Depending on the 386, I may also offer an Atari SC1224 color monitor which is in perfect condition. Unless you are local, I'm not interesting in piecing anything out.
I also have a bunch of 8bit stuff(320k 130XE, 256k 800XL, 800, 2 DD disk drives) if there is any interest.

Sounds right to me although it might be .ZIP and it's around 900k.

AIUI both versions are the same except 110 doesn't include all the original
archives, which are in 100.

> Don't know which is best, but I do know that 100 doesn't work with a
> falcon :-(

What didn't work?

AFAIK they're all C ports except MAILER which was written from scratch in LC
anyway, nothing h/w specific AFAIK.

5843. FS: TONS of ST software

Newsgroup: comp.sys.atari.st
Date: 1994-12-23 18:37:53 UTC
From: mbates@netcom.com
Message-ID: <mbatesD1A135.C89@netcom.com>
Source record: 174112

Okay, I have TONS, I means TONS of ST software left. It ranges from Desktop Publishing Packages to Games to Databases. There is a little bit of hardware (like the Robot Kit from Atari UK). I also have a Hard Drive which someone was supposed to buy. NOW, the Hard was good when it left here to this buyer. The buyer reniged and said it is bad. I NO LONGER have an ST to test it so it is AS IS. But, here is the good part:

You can have it ALL for $90 plus shipping * I GUARANTEE it is worth at least $180.

OR I will trade the whole kit and kaboodle for Jaguar Club Drive and Checkered Flag II. If you do the trade I PAY SHIPPING!!! Be warned the shipping will be around $50 UPS ground. So obviously I would rather trade.

Some of the things there are about 8 Abacus ST books, 3-4 Compute ST books, Dungeon Master & Chaos Strikes Back, Populous, Star Fleet I, TONS.. Fleet Street Publisher, etc etc. I just want this out of my house but I would also like to get the two new Jag games.

****
ACT NOW!! If you do the trade I will include about 5 years of Antics and Analogs!
****

Contact me at mbates@netcom.com or 209-462-0694!

5846. FTP sites and DOS floppies

Newsgroup: comp.sys.atari.st
Date: 1994-12-23 20:00:46 UTC
From: bclouser@lasker.Princeton.EDU
Message-ID: <1994Dec23.200046.1335@Princeton.EDU>
Source record: 174143

I have an Atart 1040 ST, and two questions.

(1) Does anybody know good ftp sites at which
I can get games and/or utilities. I am mainly
after a site that has kids games.

(2) I read some articles here about Atari's
being able to read PC-formatted floppies (720K DS DD).
Is this true? I've been downloading stuff from a
Sun workstation to my Atari at home via the kermit
utility in Uniterm, but it's slow and a pain! If I
can put these programs I want to get to my Atari
on a PC-formatted floppy at work, can the Atari then
read the files on that disk? If true, this would be
SUPER!!

Thanks for any help,

Bob Clouser

5847. SLIP for the ST?

Newsgroup: comp.sys.atari.st
Date: 1994-12-23 20:08:10 UTC
From: kerkhoff@mail.utexas.edu
Message-ID: <3dfana$169@geraldo.cc.utexas.edu>

Does anyone know of a PD SLIP package for the ST? I know of the KA9Q utils
but that package looks very difficult to install. Perhaps there is a version that is
preconfigured for the typical ST. Also, what does one use for mail, ftp and news
utils?

Thanks for any help --

Gee, that's quite a pleasant surprise! I think somebody (Simon Gornall
perhaps) is working on a nice MiNT CD-ROM, too. That'll be nice,
assuming it's got a nice MiNT-only setup on it (that's what I'm running
now when I run MiNT).

I've got the GEMini CD, and it's full of goodies... some of the stuff is
a little out-of-date though, but that's to be expected (things like MiNT
and gcc are moving targets).

>the atarian (I meen F030'an).

I've said it before and I'll say it again... Making a PowerPC-based TOS
computer would be a stupid way to commit suicide for the company
building it.

Why, you ask? Observe:

1) *All* software would run in emulation, probably about as fast as a TT

2) ST-compatible video (ie, like the ST, STe, TT, Falcon) would slow
the processor to a crawl; if you use incompatible video, you lose all
those annoying programs that try to hit the video directly

3) Linux would be the only native PowerPC software available; there are
almost *no* Atari developers left to recompile their commercial apps

#1 is the kicker though... why spend at least $2k US on a system to run
slightly faster than a TT?

If you want a good *solid* Multitasking OS try Geneva from Gribnif. It is easy to install, and with some twiddling you can get *almost* anything to run on it. It has a series of flags which you can set for each program (if necessary), which allows for great compatibility. It is also very fast and has an excellent look&feel.

As for MacMagic, I'm looking forward to it even if in only runs half the software out there...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

From: ak@nyangau.aladdin.co.uk
Message-ID: <3dfj7n$8ok@alpha.aladdin.co.uk>
Source record: 174107

I have encountered XIMG GEM Raster files with palette entries in them.
Each palette entry is 3 16 bit words. Whats is their meaning. In order to get
my testcard pictures to come out right I have to say that :-

```
byte palentry[3*2];
byte r = (byte) ( getmotorolaword(palentry ) >> 2 );
byte g = (byte) ( getmotorolaword(palentry+2) >> 2 );
byte b = (byte) ( getmotorolaword(palentry+4) >> 2 );
```

This looks a little weird to me as I don't know much about Atari hardware,
nor do I have many good testcases. So what do those 6 bytes mean?

Overlay should do these things. I don't know whether there's an English
version available, but it's a great `multimedia' program for all Ataris.
It shows text, graphics, plays sampled sounds and FLI-movies and it does
those special effects of fading pictures in many ways.

I can't tell you where to get OverLay in America, but try asking Patrick
Jerchel of OverScan (the producer of OverLay in Berlin, Germany). Patrick's
address is: Patrick_Jerchel@b.maus.de (no mails >16KB please).

Hope this helps... Merry Christmas to the electronic world.

Source record: 174114

I uploaded MIT's PGP 2.6.2 to atari.archive.umich.edu a couple of days ago after receiving it from the author, but I'm afraid I was a little premature as Harald Denker just informed me of 2 bugs which have popped up. He is working on them now, and I don't think they're life threatening, however, if you downloaded 2.6.2 be aware of these 2 bugs:

1. Using the -s and the -sta option produces a signed file without a name. It only has an extension (.pgp or .asc)

2. Using the -ka option to add a new key then certify it, seems to work, but at the very end before exiting, PGP produces this error:

Can't open secret key ring file ''

P.S. Sorry about this. Just hold tight.

> for example, take a 68000 .ttp over to a 68030 system, run it, and
> expect to draw any meaningful conclusions.

What I did was to take a copy of dhrystone.c and compile it up under GCC.
I then used the *exact* same binary to test 25 or so Atari configurations
(thanks to all the people who actually did the tests for me). I used the
same binary both on 68000 and 68030s as I figured that most Atari software
didn't make use of the 68030 instruction set *even* if it had TT or Falcon
only features.

I distributed the source, the makefile and the executable to all testers
so they had a base to work from and understood exactly what the test was.

The results I ended up with are a *relative* comparison of the CPU performance
of Atari machines. I happened to use the dhrystone benchmark to achieve
this - but I could have used any arbitary test. I'm *not* making any claims
for dhrystone tests across platforms - though I have included a few non
Atari results for interest value.

> dhrystone is also a CPU-only benchmark. disk, display, and many other
> system elements are not tested at all.

Agreed - but actually I'm *only* interested in CPU performance. Caches and
memory type does affect the figures as does screen mode. Though of course
in the latter case I make no claims about drawing speed, just how certian

resolutions affect the result.

> be careful in interpreting dhrystone results. in fact, i'd go so far
> as to recommend abandoning it unless you really know what it does
> and how it does it (ie, study the source code)...

Well I will admit I haven't studied the source in any detail - but I believe my testing criteria is strict enough for this not to matter. In general though, I've had enough experience with dhrystone in the past to realise that cross platform tests can be *really* out.

:-)

Roland.

@CiX

BTW I'll be posting an updated list soon, probably to ~.tech only.

> the buy, with its way too high price. What happened to POWER without

Very few people can justify the price of a TT. They are considerably
cheaper second hand however.

> PRICE. I think is time for ATARI to lower TT030 prices if they want

This would IMO be a very good idea. There have been a few coments about
the Falcon being the successor to the TT, but IMHO there wasn't really a
lot wrong with the TT. Okay it could have done with an 800x600 16 colour
mode, but there *was* OverscanTT which did much the same as BlowUp does
for the Falcon. True it doesn't have a DSP as standard, but there is a VME
slot which would probably get around this. In all other respects though,
the TT is a *better* machine than the Falcon, and I don't think there are
many TT owners looking to exchange their machines for Falcon.

The TT costs to much though, and has always done so.

> I know several users who have change platform, not because
> they didn't like ATARI, but because ATARI decent machines are too
> expensive.

Or if you have the money - buy the TT, *and* buy something else. Okay so
you could probaby buy a very nice machine for the cost of a TT and
something else, but IMO a TT is worth having in its own right. Its
inablilty to run industry standard software makes it worth buying something
else as well.

Its not all bad news for the TT anyway. A TT with a 19" mono monitor and
Linux - is going to make a very nice X station. The Falcon OTOH is
underpowered for this job IMO.

:-)

Roland.

I have the following ST stuff for sale. Everything has the box and the
dox unless otherwise stated.

I am asking $5 each [extremely negotiable so e-mail me] I'll pay shipping
if you buy more than one. E-mail me if you are interested.

The Lurking Horror InfoCom
Skyfox EA
Q-ball Mindscape [lost the dox :( ]
Phantasie III SSI
Lemmings Psygnosis
MircoDeal Hits Vol 1 Microdeal [has Goldrunner, Jupiter Probe,
Slaygon, and Karate Kid II]
Dragon's Lair Readysoft
Pirates! Microprose
TetraQuest Microdeal
The Golden Path Firebird
Trinity Infocom
Leather Goddesses Infocom
Checkmate Interplay
Time Bandit Microdeal
Space Quest III Sierra
Zany Golf EA
Barbarian Psygnosis [this game has a hack, you'll never die]
Gridiron Bethesda
Hoyle Book of Games 1 Sierra [no box]
Zebec Gueydan Enterprises
Risk Virgin Games
Colonial Conquest SSI
Turrican Innerprise
the Pawn Rainbird
Balance of Power Mindscape
SPace Ace ReadySoft
Tracker Rainbird
Wargame Construction SSI
UMS Rainbird
Brataccas Psygnosis
.....
I also have InterLink ST [comm proggy], NEOdesk 3, EZ-Track Plus, and GFA
BASIC 3.0 with programmer's reference guides. I don't know what these
are worth, make me an offer.

5863. Atari vs. PC

Newsgroup: comp.sys.atari.st
Date: 1994-12-24 03:26:16 UTC
From: jonaeson@algonet.se
Message-ID: <3dg4co$crn@aristotle.algonet.se>
Source record: 174127

Lately it seems to me as all disussions are more and more related to
Atari vs. PC/Mac/Unix.

Before I say what's on my mind, I'd like to state that such discussions
should be carried out in atari.advocacy.

Anyway, here it goes:
A lot of people complain about the high price of the Atari, well, here's
my humble opinion about it!

First of all, we all have to accept that this isn't the mid-80's, and the
competition on the home-computer market has forced the PC-prices down to
a level where it is hard for a small company like Atari to compete.
Thus we will have to accept a higher price on Atari-computers in the future.

BUT, your Atari computer isn't the only part of your system, and you
should consider that. Today hardware like monitors/memory/harddrives and
other things are universal, things you can use with almost -any-
computer in the market.

When you buy a F030 you should consider that the harddrive you get,
monitor you get, and memory you get (if you have a SIMM-RAM-card) is
always portable to your PC (if you have one/plan to buy one), or to your
next computer.

Getting a non-equal PC-setup is cheaper, agreed, but comparing the systems
are to some extent like comparing apples & pears...
Getting an equal PC-system is more expensive (SCSI&IDE, DSP etc).

Some parts are just as expensive, others are more expensive, and others
are cheaper.

Besides, PC-systems often uses parts that are non-portable. (the cheapest
CD-roms are non-portable)

There are lot's of reason against&for PC & Atari, and comparing the
prices isn't the way to go in my opinion. The pricedifference isn't that
big IMHO, that it justifies buying either, if you are indeed interested
in Atari.
Instead consider your needs, and other things, like programs, OS etc.

Anyway, just my opinion...

Regards, Tommy

5864. Software needed

Dear Friends,

I am looking for Atari upload/download software for a friend: he has an
Atari 1040 STF with TOS 1.4 OS. Could you please give us some help and
information on how to find the required software?

Your aswer would be very much appreciated.

Regards,
Tamas Keresztes

5865. 3X CD Drive for only $200!

Newsgroup: comp.sys.atari.st
Date: 1994-12-24 04:45:59 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <hawVPbX.johnhechtman@delphi.com>
Source record: 174129

** How I was able to get a 3X CD-ROM working for only $200 **

After reading on Usenet that Mark O'Bryan (obryan@gumby.cc.wmich.edu) was able to get a 3X CD-ROM working for only $200, I decided to try the same model (a Toshiba XM5201). At first, I could only get the CD-ROM player to work by itself. Whenever I plugged my Maxtor hard drive or my Insite floptical drive into the chain, nothing worked. I spent several unhappy days trying every possible variation of hooking the drives up, with terminators, without terminators and in every possible sequence.

Previously, when I had first hooked my floptical into my hard drive, I did so with a 50 pin Centronics to 50 pin Centronics cable that was wired pin for pin, so that pins 1-50 equaled pins 1-50. It was what I had lying around, and at that time I didn't know that 50 pin SCSI cables are wired differently, with pins 1-25 jumpered together. The 50/50 cable worked perfectly! I have been using it for a couple of years with no problems.

When I got the CD-ROM unit, I decided to play things safe and got some "real" Centronics 50 pin to Centronics 50 pin SCSI cables to do the hookup. No matter where in the chain I hooked the "real" SCSI cable, it took down the system and I was left looking at a desktop with two floppy drive icons on it.

I beeped the cable with an ohmmeter (I'm an audio tech) and other than the jumpers across pins 1-25 it was fine. Thinking I might have a defective cable, I returned it for another one which also beeped fine and showed the same 1-25 pin jumpering as the first one. The second cable did the same thing to my system as the first one - bare desktop with no indication of my hard drive, floptical, or CD-ROM.

In desperation, I tried hooking the CD-ROM in with another 50/50 pass-through cable (no jumpering) and everything worked perfectly!! I talked to Ray (the tech at Toad who had been advising me) and he'd never heard of such a thing. Then I talked to a fellow audio tech who also does a lot of set-up of computer systems. My friend said that he had run across the same problem when setting up other SCSI-1 systems and had found the same solution.

With the "wrong" cables, everything works perfectly, the CD-ROM plays music and accesses files and images. As soon as I figure out how, I'll try running a photo-CD seesion and let folks know how that works. My hard drive and the floptical are back on line and working fine.

I'm not a heavy enough computer tech to say why this works - maybe someone here who is more knowledgeable can do so. But I can tell you it _does_ work, that's good enough for me (grin).

Be careful if you try this trick - not all "parallel" cables are pass-through type. Some don't have all the pins wired and some have jumpers

on other pins. Beep the cable first to make sure of what you're dealing with. If you don't know how, or don't have an ohmmeter, find someone who does.

A word about termination, you are supposed to have terminators on the _first_ and the _last_ unit in the SCSI chain with _no_ terminators on the units in the middle of the chain. I'm not sure how critical this really is, my Maxtor and my floptical both had terminators in place and worked fine. What I found out from Ray (Toad tech) is that the Link 1 _also_ counts as a terminator and so the drives following it should have no termination, except for the last drive in the chain.

I also had to add the D=10 option to my extendos.cnf file, so that extendos would treat my Toshiba CD as an earlier model, to play audio CD's. My current extendos.cnf file looks like this:

```
; this one works -installs as drive P
*BOS, C:\EXTENDOS\CD.BOS D=10, Z:5
*DOS, C:\EXTENDOS\UNIDRIVE.DOS P=8 B=8, P:Z
*DOS, C:\EXTENDOS\UNI_BDDS.DOS P=8 B=8, Q:Z
```

This sets my CD up as drive P for normal use and drive Q for CD's that are missing one of the two standard information sets (as per the extendos manual). It also sets my path buffer and cache sizes for a bit of performance tweaking without eating too much memory.

So now I can finally recommend the Toshiba XM5201 CD-ROM to my fellow Atarians. They are currently selling for $199 at Macwarehouse. My model is an XM5201B (no RCA jacks on the back, but the drive has a plug you could hack) Mark O'Bryans is an XM5201A which has the jacks, but is currently out of stock and 60 day backordered. Both units have a front headphone jack. So go get 'em troops, CD for the masses! Power without the price!

The Macwarehouse number is 1-800-255-6227 and it's item #BND-0507. Buy your Extendos software from Toad - they deserve the business after all the help I got from Ray to set this system up. Toad's price for an NEC 3X CD-ROM is $459 and Ray could have easily told me to piss up a rope since I didn't buy the Toshiba from them. Instead, he politely helped me to resolve my problems!

At the same clockrate? That I doubt _very_ much! And also the price will be
higher than for an 040, and *way* higher than for a PPC.

Well, I know of at _least_ the following:

- GEMini Atari
- Atari Mega Archives
- Crawly Crypt
- Skyline
- 3 Atari volumes from CD Service (Ausgabe 1,2,3)
- 2 disk set from Suzy B's (coming soon)

- Sterling QuickForms CD
- Bitsream 500 Fonts CD

Plus, there's lots of non Atari-specific CD's out there that work
great on the Atari. Get in touch with Greg at It's All Relative
(greg@genie.geis.com) for complete details and ordering info.

Well, one suggestion would be to change the file protection,
because currently it's "eero.lzh: Permission denied". :-(

Hendrik is correct, that the PPC emulates a 68020, which has nothing
to do with its speed.

> Don't know anything at all about IIRC. My comment was based on personal
> experience with a PowerMac 7100/66 (at my office) and a Quadra 660av (at
> home).

Hutch, have you actually benchmarked this, or is it purely seat-of-the-
pants? I ask because I remember reading the benchmarks in MacWorld
that showed the PPC emulation running 2-2.5x slower than an 040-33,
i.e., 40-50% of its speed.

(I've also read that Apple has an improved emulator in-house, that
tuns twice as fast, but is reluctant to release it because it might
reduce the incentive for developers to do native versions.)

> The PM's 680x0 emulation is nearly the same speed as my 040-based
> Quadra which has been boosted to 32MHz. The PM's emulation would be a lot
> slower than a 40MHz 040 and a bit slower than a 33MHz 040 but it's decent.

2-2.5x slower seems like more than "a bit slower" to me.

My point is, that they have released a version of Magic for the ST while
the Falcon has been at the market for a long time. I find it very hard
to understand why they support the ST, and not the Falcon. You say a Falcon
version is beeing worked on, but i also find that hard to believe, when
they have just released the Mac version as well. What the reason for
releasing ST and Mac version, but not the Falcon version. Thats a thing I
do not understand at all. And to be honest, i really doubt there will ever
be a Falcon version.

: (greg@genie.geis.com) for complete details and ordering info.

...Also:

SARA Search and Retrieval Software

For the Atari Computer

SARA Search and Retrieval Software will allow you to search and view the
information on many CD's currently available on other platforms.

SARA has support for the following CD's

The Family Doctor - DOS Version

Sherlock Holmes on DIsc

Multimedia Audubon Animals

Wayzata World Fact Book

Time Man of the Year

The Art History Encyclopedia

Software Toolworks Reference Library

Text can be accessed with any Atari computer from the ST to the Falcon and TT
using either a monochrome or color monitor in 80 column mode.

Graphics can be viewed on any Atari with 16 colors available in 80 column mode
(TT and Falcon).

You will find having the Software Toolworks Reference Library at your fingertips very handy.

SARA requires a CD rom driver. We suggest ExtenDOS Pro by Anodyne Software for
best use.

Source record: 174145

That resistor. Even though I noticed some radio interference when I measured voltage across this resistor it was only after I had desoldered everything on the board and tested each component(except the transformers) that I discovered the burnt out resistor. It looked a little darker in colour as well. It appeared to have resistance when soldered onto the board. By the way the power supply gives out a slight sizzling whistling sound when in operation. What causes this?

*** CREATOR SL 64 TRACK MIDI SEQUENCER PROGRAM FOR SALE ***

* One of the best (some say _the_ best) sequencers for the Atari ST or any other platform.
* Fully supported by Emagic (I own Notator and just got the latest ugrade disks free of charge).
* Upgrade path available from Emagic for Notator SL (scoring capability) or for use with Falcon (Notator Logic - which also runs on the ST). Cost to upgrade to Notator Logic is only $144 USD. The cost of Notator Logic _new_ is $500-something. You could buy this copy, upgrade, and save $231!
* Up to 64 MIDI tracks with ultra-high 1/1260 ppqn tick rate.
* Comes with original disks/manual/copylock dongle, all in perfect condition.

Q: If this program is so $#@! good, why am I selling it?
A: Because I _already_ own Notator! This copy came from the original owner as part of a package deal - I don't need _two_ copies. ;)

Q: How much is it?
A: Only $125 USD for what was over a $500 program!

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Bix1v5v.lmcclure@delphi.com>
Source record: 174146

In a message dated 12-20-94, Petri Aukia said:

"My brother has a 12" Atari RGB -monitor. Does anyone know
the vert / horiz freq. of this monitor?"

It sounds like what you have is an SC1224. For this, the horizontal
scan rate is around 15.75Khz (i.e., the same as a TV), as is the
vertical (50Hz for PAL, 60Hz for NTSC).

"Is it TTL or RGB -valued?"

The video inputs are analog RGB, like VGA, but the scan rates are
incompatible.

"Could it be used on a Mac?"

No. All Macs use a much higher horizontal scan rate. It can be used
with the Apple IIgs, with proper adapting of the sync signals, as
the IIgs uses the same scan frequencies. However, again, not with
any model of Apple Macintosh.

Source record: 174148

In a message dated 12-22-94, Scott McIntyre said:

"Is there any sort of a program for PC's or Macs which will
allow them to read an Atari disk?"

This question comes up so often is should be in a FAQ.

As regards reading the ST disk in the PC, has the attempt been made to do so? Many times, an ST disk will read in a PC with no problem, depending on what TOS version is was formatted with, whether it was an extended format or not, and the disk controller and BIOS on the PC.

However, if there is any problem, I suggest getting the freely distributable program FDFORMAT for the PC. Although this is intended as a extended space formatter for the PC, I have found its included TSR can make otherwise unrecognized ST disks readable by PC's.

If the Mac is a relatively contempory model (i.e., has a high-density Superdrive), it *may* be able to read an ST disk. I know these Macs can read high-density PC disks, but I have idea if this capability also includes standard double density 3.5" disks. If so, the Mac should also be able to read the ST disk.

The ST format was *meant* to be PC-compatible. Only problems caused by how early TOS version formatted diskettes, and the problems of some PC's not adhering close enough to standards creates difficulty in some cases.

> things even lock up. Anyone have any suggestions?

Sounds like you`ve got a XON/XOFF-problem. Make sure the cable that connects your modem to your computer supports RTS/CTS, enable RTS/CTS in your terminal-program and hopefully everything will work.

If the cable you are using came with the modem it _should_ support RTS/CTS. With RTS/CTS you should have no problems running the port at 19k2 bps giving you twice the throughput.

If you transfer a _lot_ of uncompressed text maybe you should consider modifying your MegaST to handle 38k4 bps. With V.42" (which I assume your modem supports) you often get 2000-2500 cps if only your DTE-speed is high enough to handle it.

Hope this help!

Merry Christmas!

5888. Re: Harddrive questions and request.

Newsgroup: comp.sys.atari.st
Date: 1994-12-24 16:22:28 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BA6WXbk.lmcclure@delphi.com>
Source record: 174149

In a message dated 12-22-94, Michael Steve said:

"I don't know what the max size of a drive should be, I know
about partitioning, but don't know to what extend this
doesn't get detrimental to the operation of the computer."

In my experience, partition size only becomes a significant performance factor when the partition becomes fragmented, which can happen very quickly on a partition upon which frequent delete and write operations take place. For best performance, I suggest putting items that rarely involve write/delete operations (i.e. programs) on their own partitions, and data files on another, and running a good defrag utility on the data partitions at least when you notice a performance drop.

Also, when extending partitions beyond the standard 32meg GEM size supported by TOS 1.4 and greater (16 meg for 1.0 and 1.2), keep in mind this increases the cluster size, and with it, the minimum file size. If you are storing files that are always a few K, this is not a factor, but should be kept in mind if you have any partitions where you might store many very small files.

"I also would like to know what access speeds the mega2st can
handle from the various drives."

Basically, other than the speed of the drive, the Mega ST should be as fast as any other ST. RATEHD.PRG says my "old" Quantum LPS52S gets over 1100K/second. I believe max throughput for the ST is supposed to be about 1.33 megabytes per second.

"I know, that for the Link to work, Parity should be disabled,
but what else do I have to worry about?"

Worry about if you can actually disable parity. On some modern drives, their is either no option to do this, or only an option to do it in software (meaning either having to hook it up first to a system that *can* handle parity, or shipping it back to the drive manufacturer to have them change it). I strongly suggest finding out if the drive you intend to purchase can have parity disabled by a hardware jumper.

"When I purchased the computer system, I received the Harddrive
and the link for free, but I did not get any of the Link
software. So I will need to get the software from ICD.
I need their address and phone # so that I can contact them."

The older (i.e., non-Link) software can be had on services such as GEnie, etc., or from fellow ICD host adapter owners. However, it lacks some of the support the Link software has (i.e., floptical support),

but will do for standard HD operations until you get the Link software.

I believe ICD charges about $10 for replacement Link software or upgrades, but you can contact them via Internet at:

ICD@genie.geis.com

The address I have is off some old info, but is likely still current:

ICD, Inc.
1220 Rock Street
Rockford, IL 61101
(815) 968-2228 (voice)
(815) 968-2229 (modem)

"...does anybody have the specs on the Link II so that I can look at them, or know any problems that I may encounter with my current system {Mega2ST}?"

The Link II is essentially the same as the original Link, with the exception that it supports parity, and has an LED indicating the precense of TERMPWR (necessary to operate the Link). I believe it also has a second LED, but I cannot recall if it indicates activity, or some other function.

5889. Re: Falcon sampling

Newsgroup: comp.sys.atari.st

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Jgy2vRv.lmcclure@delphi.com>
Source record: 174150

In a messaged dated 12-23-94, Richard Morris said:

"Is sampling on a Falcon as easy as plugging in the source
thru the RCA in ports and then running some program to
sample sound?"

Not really, since the Falcon uses a stereo mini-jack for input for input, rather than RCA jacks. Another snag, as I understand, is that the input is set for mic-level signals rather than standard audio level signals, meaning use of an attenuating cord is required for good results at best, and preventing harm to you Falcon, at worst. (An attenuating cord is a fancy way of saying a cable with the proper value resistor[s] inline to cut down the voltage level of the signal).

Of course, unless you have your eye on a used Falcon, you might want to wait and see what the Mk II Falcon C-Lab is supposed to release looks like and is priced at. I imagine it will address some of the gripes about the Falcon's audio I/O setup.

>ATARI, but because ATARI decent machines are too expensive.

The problem with that is that Atari does _not_ want to compete in the
computer market anymore. All they care about is the games-console
market. New TT sales are pretty much driven by the Jaguar now, since
the Jag developer's kit is a TT plus some extra goodies.

YES! Get that damn ST-RAM out of there, and give us SIMM slots.

>- 1024x768x256 (A BYTE PER PIXEL MODE IS NEED *SO MUCH*)

YES! Easily done with almost any off-the-shelf PC video card.

>- 1024x768x65536

No way, 2M VRAM is expensive. Make it an option. If the system is
designed to take an OpenBoot PCI card, you can plop in any 2M video card
for this. It'd also open us up to a wide range of accelarated video cards.

>- Replace the jack sockets with LINE IN/OUTS.

Yes!

>- PC Style Case and seperate keyboard(dirt cheap)

Yes!

>- 3.5 " Ide drive(cheap)

SCSI-II on the motherboard would be cheap, and opens up a tonne of
possibilities (CD-ROM, tape drives, scanners, ethernet, many drives at
once, etc).

>- PCI expansion bus.

Yes. And design it to conform to OpenBoot so you can plug in _any_
OpenBoot PCI card and have it work. No more waiting for drivers!

>Other things to consider might be:
>
>- more DSP ram! (a shared CPU/DSP ram segment would be nice, possible?)

I say no DSP standard; get it on a PCI card.

>- VRAM (high rezs really sllooww the falcon down).

Just use off-the-shelf video and contention goes away.

>- Speed the Blitter up or design a new one ;-)

No point; buy an accelarator card.

>- Magic/NVDI OS on Rom ;-)

That would certainly be good, but I'd probably run Linux on this anywway.

>(I find it hard to enthuse about 40mhz 030's when I'm typing on a PA-RISC :-)
>but you can dream....

No kidding. Especially when you wake up and consider what Atari would
probably charge for such a machine...

>only features.

there is nothing wrong with your procedure, provided you mention it in
your results. my point was to emphasize the fact that compilers can play
a large role in dhrystone. if a *system* consists of a computer and its
software (including compilers) then your test may not, however, fully
test each system.

the problem i see is that people interpreting results have a tendency to
latch onto a single number. it would, therefore, be inadequate to state
that the dhrystone rating of system A is X and system B is Y, etc, based
on your method (though i would suspect that GCC would be about as close
as you could get to maximum performance via a compiler). i do not know
what impact compiling for 68030 via GCC would have on systems with 68030s,
however, so i cannot state how far off your test might be (if someone
were to use it as a sole metric).

note that i have even seen disclaimers on dhrystone posted (recently) by
its author.

>The results I ended up with are a *relative* comparison of the CPU performance
>of Atari machines.

well, ok...

you should also know that dhrystone v1 vs dhrystone v2 can give about a 2x
difference in results, on the same system, with the same compiler, if you
can inline some functions in v1. i have not looked at dhrystone in a long
while, but i seem to recall that inlining the strcpy (?) will save quite
a bit of overhead in the call since it is in a fairly tight loop. this
was "corrected" in v2.

also note that dhrystone ratings are still quoted by many vendors (mostly
in the workstation market).

Get HSMODA04.LZH from atari.archive.umich.edu in ./atari/Telecomm/
and put DRVIN.PRG and MFP.PRG into your AUTO folder, in that order.

Then, set your comms program to 19200 baud, turning RTS/CTS flow control
on. Also, turn RTS/CTS (Hardware) flow control on with the modem,
(usually &K3 and &Q5 will enable full error-control, compression and
RTS/CTS).

Doing all this, _should_ rectify the problem!

> they have a chance to dig into the market again!)
<Cough> with a 2 billion USD turnover (approx), I wouldn't say Apple are dying just yet. The Power mac seems to be carving quite a reputation for itself and SYS7.5 whilst too big, ugly and slow for me, has a lot of people excited.

> I heard that in the next few years, there is going to be ONE OS running
> on all machines... a "standard"... This got me frightened! Are people
> going to be whitewashed and see everything in one color? It might be
> true!
I seriously doubt there will ever be one OS. Competition is the name of the game, firms are always going to want to be seen as having superior products to others and OSs are no exception. Even when they are supposed to be alike ie Unix, the comman set, interfaces and netwoking are all different in many subtle and not so subtle ways.

> So... I have a suggestion for computer designers/hackers/or even
> ATARI...
> Why doesn't Atari make a computer based around... THE JAGUAR's chipset?
Atari have *no* interest in computers now. it's Jag, Jag. jag, all the way. A 3rd party may be interested if the Jag takes off big time but with the Jag card for PCs on the way, I really don't think it would have a future.

The future for TOS machines IMHO lies in MagicMac and/or machines like Medusa for the real high flyers.

> Given its specs, I'd say that if you added more ram(8 megs+), it would
> have more firepower than the current computer offerings. Port over a
> version of Unix, and then you're rolling...
Unix is useless for home users and that's all Atari machines will ever be, anyone who thinks otherwise is deluding themselves. The business market is too focused on PCs and Macs (with a fair bit of Unix workstations) to see anything else.

> I'm sure there are people out there that are SICK of seeing "Intel
> Inside" and "PowerPC" logos... they want something more along the
> lines of a cheap SGI... Perhaps there could be a market for such a
> machine. Given Atari's current financial problems just trying to
> market the Jaguar(poorly, as it seems)... perhaps it would be within
> their best interests to license off the design to some company to
> DEVELOP this Jaguar-Based RISC computer.
They licensed of the Falcon as it has a sort of future amongst the MIDI

people. A Jag based Atari computer will never happen as it has no market.

> What do they have to lose? It certainly wouldn't hurt them...
Yes it would, have you any idea what it costs o design and market
hardware? It would destroy Atari. Jag is their only hope.

> And just so I don't seem like an Atari fanatic---why doesn't Sega do
> this either with their new Saturn-based technology?
No idea. Same reasons I expect.

5901. Pagestream question

Newsgroup: comp.sys.atari.st
Date: 1994-12-25 00:29:24 UTC
From: hellman@teleport.com
Message-ID: <3died4$mj@kelly.teleport.com>
Source record: 174018

Hello Pagestream Users,

After saving my text tags in a document I get bombs when I try to
load (append) them into another document. Has anyone been succesful in
doing this?
I'm using v 2.2b on an STE.

Thanks in advance.

You can add three other CD-ROMS:

Power CD from Composcan (shareware)
and recently:
BINGO from Software Service SEIDEL (shareware)
WOW from Software Service SEIDEL (fonts, graphic, shareware)

Merry Christmas !

It doesn't work on a Falcon, that's right. But other than that?

It works really great. Very fast and reliable. I guess you never actually seen
it or even used it? Thought so ...

>To me all OEM OS's are just hacks, they will never ever be compatible..

If this 'hack` is well done an will be supported in the future I do not see
the problem. You should realise that there will be no future TOS made by Atari
itself. The Mint part of it will be kept alive by the community out here in
netland.

: CPU: Motorola 68030 running at 33 MHz
: RAM: 5MB expandable to 36MB
: Also built in speakers
: CD-ROM Drive with Double speed.
: Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors
: Disk: Hight density
: HD: 160MB
: Comm: Modem and Comm prog., STALKER 3 for example

: Software included: ATARI WORKS, Home Account 2, Stalker 3, also
: 4 CD ROms, plus games ,etc.

: Price: US$1299!!!

: Think about it, would you by it?
: Will ATARI give you such a sweet deal?

No built in speakers! 'm very picky about my sound system, and I want to be able to choose the speakers that I like. I mean something on the order of multimedia speakers that sound like home stereo speakers, and not like the SC1224's squawker. And monitors don't determine colours; computers do. I'd also want a bigger hard drive, a DSP (Motorola DSP96002 would be ideal, a DSP port, MIDI ports (of course), twin DACs, stereo audio in jack (NOT 0.5MM pin jacks!), stereo audio out (RCA, stereo and/or pin for headphones), and a number of other things -- but these are wha I would put in a dream Atari.

>> CPU: Motorola 68030 running at 33 MHz

TT: 32 MHz. Upgradeable to 040/060.

>> RAM: 5MB expandable to 36MB

5? I'd prefer 6 (2 ST, 4 Fast), expandable to 4 ST, 128 Fast
(theoretically, that is) with PS/2 SIMMs.

>> Also built in speakers

Nope. Standard Cinch connectors. Falcon audio subsystem!

>> CD-ROM Drive with Double speed.

SCSI, of course.

>> Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors

Should NOT be included (I am planning to buy a Sony 15sf rsn).
640*480 32K is not satisfying. PCI slot! NVDI/ET4000 should run and
NovaVDI would run with ATI boards, IMHO. (NVDI 4 Nova is already planned).

>> Disk: Hight density

ED drive built in (heck, it's 50 $ difference over here, so why bother).

>> HD: 160MB

Nope. SCSI connector and NO drive. Enough room in the case for a 3.5"
SyQuest and another 3.5" drive. (a 540 Quantum costs around 300 $ over
here, so why that cheap, small drive?) Perhaps Atari should only ship the
board?

>> Comm: Modem and Comm prog., STALKER 3 for example

ConNect, UPoint medium and CAT included :-).

>> Software included: ATARI WORKS, Home Account 2, Stalker 3, also
>> 4 CD ROms, plus games ,etc.

I still don't want Stalker. Dunno about the others, tho. 4 CDs would be
nice if filled with clean software (except for games and demos), but not
if filled with incompatible crap. MultiTOS II, eXtended File Systems with
64bit sectors (instead of 15 bit) and speed optimized (NVDI included?).

>> Price: US$1299!!!

Acceptable.

>The machine you described above does exist. It's called the Macintosh Performa
>550 and was only $1199.

Mac pro forma :-)

```
ANNOUNCING version 0.26 of the Okami Newsreader.
================================================================

OOOO
OO OO O K A M I
OO OO
OO OO N E W S R E A D E R
OOOO

================================================================

Okami (also known as O) is a suite of programs for storing, reading
and generating Internet and Mausnet (German) news and mail offline.
The current version supports both UUCP and SOUP for Internet.

The program has the following features:

- multi-window user interface
- up to 256 windows (if the operating system can handle them)
- newsgroup folds
- file browser
- semi-automatic PGP interface
- regular expression or string search
- built-in uuencode, uudecode, btoa, atob
- multi-volume message to file save
- Rot-13 and Rot-18 encryption
- built-in metric conversions
- thread walking
- pseudo newsgroup for outgoing messages (Outbound)
- pseudo newsgroups for mail and mail-archive
- built-in Mausnet support
- user-definable command-oriented keyboard layout
- configurable on-screen text effects
- configurable on-screen TEX conversion
- command shell interface
- user-definable quoting style
- cancel-message generation
- super smart signature system
- Hall of Fame

The program is now available on ftp.informatik.rwth-aachen.de:
/pub/atari/uucp/o_026.zip, ftp.cnam.fr: pub/Atari/Telecomm/o_026.zip,
sun.rz.tu-clausthal.de: pub/atari/telecomm/news/o_026.lzh, and on
atari.archive.umich.edu, micros.hensa.ac.uk.

: after a site that has kids games.

Do one of the following:

FTP to atari.archive.umich.edu and look in /atari/Games/Kids-games
Gopher (the preferred method) to gopher.archive.umich.edu and do the same.

: (2) I read some articles here about Atari's
: being able to read PC-formatted floppies (720K DS DD).
: Is this true? I've been downloading stuff from a
: Sun workstation to my Atari at home via the kermit
: utility in Uniterm, but it's slow and a pain! If I
: can put these programs I want to get to my Atari
: on a PC-formatted floppy at work, can the Atari then
: read the files on that disk? If true, this would be
: SUPER!!

It's true, yes. You can take a 720K formatted IBM PC disk and read it
directly on the Atari. Similarily, if you have TOS 1.04 or greater, any
disk formatted on the Atari is automatically readable by an IBM PC
(formatted to 720k, of course) ... of you have TOS 1.02 or below, you'll
need a program that wwill install an IBM bootsector... there are many of
those around.

: Thanks for any help,

: Bob Clouser

do> version of Unix, and then you're rolling...
do>

Nah, I think computer hackers would more like to see the PowerPC with
PCI interface take off. Then one would have a cheap source for decent
hardware. Then run something like Linux or Hurd or Gnustep on it.

That's what I'd like to see anyway.

do> And just so I don't seem like an Atari fanatic---why doesn't Sega do this
do> either with their new Saturn-based technology?

Because the PC market is full of lemmings. They'll buy what they are
told to buy. Today, this is a 486 clone running Windblows. Tomorrow
it'll probably be a pentium running NT workstation or Win95. After
that - who knows. It might be a PPC running NT workstation. I can't
see how any company could start afresh and push a *new* computer
system to the masses. Hell, even IBM seems to fail with its' massive
advertising campaign for Warp OS/2.

do> This is just a thought.
do> Feel free to reply.

I did. So, now you know my thoughts.

5915. Info on 520STs?

Newsgroup: comp.sys.atari.st
Date: 1994-12-25 20:20:33 UTC
From: angst.umpi.maine.edu
Message-ID: <3dkk6h$22l1@saturn.caps.maine.edu>
Source record: 174033

My father was recently given an Atari 520ST that someone
needed to get rid of. He seems to have it up and running and
is very happy with it, but would like to use it to get connected
to the internet.

I know virtually nothing about the machine but had him read me the
specs out of the original manuals over the phone (He lives in LA and
I live in ME). It seems like a cool little machine albeit underpowered
compared to today's machines.

I'd like to help him set up some basic comm functionality with his
system. The manual states that the built in RS232 port can handle
buad rates up to 9600 bd. He also has a vt52 emulator built into the
GEM(?) gui os. Can he go out and purchase a hayes standard 9600 external
PC modem and hook it up to the RS232 port?

I'm a fairly cabable Internet Navigator and have read all the atari
newsgroups, browsed atari web sites, done veronica searches, and browsed
ftp sites looking for stuff for the 520ST. I haven't turned up *anything*.
Everything is aimed at MegaSTs or Falcons.

I am interested in *any* information on the 520ST such as vendors,
software sites, hardware options, and the like. Also, I'd like some
info on the various Atari systems such as the MegaST and Falcon;
particularly on the processors, hard drives, floppies, and other sub-
systems of each.

Many thanks to you all...
Rick

[sorry, for all the crossposting, but I'm trying all possibilities
suggested by this trackball...]

A long while back I picked up a Kraft Trackball in a trade
It's just the unit, no box, manual, etc... And there's a bunch of things
about it which I'm wondering about.

It's grey in color except for a single cornstarch blue button.
It's more or less wedge shaped (more like a fancy looking futon shape
from the side. =^) ball in the middle, three buttons along the bottom.
At the top is the blue button which I've determined to be a "drag" button
(it puts out a button-down signal when set) and above it is a switch
marked AF--D. At the top side, next to the cable is a 6-pin telephone
style jack which only uses the two middle pins, on the side is a 3 position
switch which determines it's function, identified by a label on the
underside:

```
_____________________________________________
| |
| COMMODORE 64/128 |
| ATARI ST AMIGA ATARI 400-1200 |
| MOUSE 1 2 3 |
| JOYSTK 3 3 3 | ("JOYSTK" is actually
| | printed as so)
| M A D E I N T A I W A N |
| M A N U F A C T U R E D B Y K R A F T |
|_____________________________________________|
```

Outside of the "Kraft", there's no indication of model number
or such. Anyone?
Main questions I have though are, what is the phone-jack for
and what does the AF--D switch do?

The trackball looks like this...

> BIOS capable of using the SCSI-chip.

I think thisis the problem. Whereas many people agree that SCSI is better
than IDE (or even EIDE), its still cheaper for PC manufactures to fit
(E)IDE - mainly because of the almost zero cost of the adaptor board - and
the *slight* cost saving of the drive itself.

Now AFAIK PCI PC motherboards are quike likely to come with a SCSI
controller on them - and therefore more and more SCSI only PCs will appear.
However IDE is not going to vanish overnight becuse in all honesty there
is *nothing wrong with it* as far as the majority of custormers and clone
manufacturers are concerned IMO.

> Although I still do believe SCSI is the way to go ;-)

I don't much like (E)IDE. I happen to have one in a PC that works extreamly
well - so I'm not complaining too much. If I buy another new drive its
likely to be SCSI though.

Roland.

Is it such a bad thing that there is one standard - especially when they
will be about 5 different OS to run on it?

> So... I have a suggestion for computer designers/hackers/or even
> ATARI... Why doesn't Atari make a computer based around... THE
> JAGUAR's chipset?

Because Atari honestly can't afford to. They don't have the money to sell
a machine like this in enough number to make it worth while.

> Given its specs, I'd say that if you added more ram(8 megs+), it would
> have more firepower than the current computer offerings. Port over
> a version of Unix, and then you're rolling...

But the point about the new Apple/IBM offerings is that they are going to
leave most current machines standing anyway. They will also run
DOS/Windows, OS/2, Unix and MacOS out of the box. Its not going to be that
hard to get TOS running on them - especially now that MacMagic is
available.

> I'm sure there are people out there that are SICK of seeing "Intel
> Inside" and "PowerPC" logos... they want something more along the

Yup - people are sick of them

> lines of a cheap SGI... Perhaps there could be a market for such
> a machine. Given Atari's current financial problems just trying to

Yes - there would bea market - but how large? I think us Atari owners are
sometimes guilty of forgetting just how much the market is dominated by
PCs and Macs. People are going to be wary of any machine which is
compatible with these 2 platforms no matter how *good* the technical
specification is.

Running Unix is also not a total cure for software incompatibilty. While
there *is* a vast amount of easily portable Unix software, its not the sort
of stuff which will sell a machine with a Jag chipset. Accepting Jag
cartridges is a mpre useful feature - and the ability to run PC software
even more so.

> What do they have to lose? It certainly wouldn't hurt them...

An awful lot of money :-(

> not, however, fully test each system.

Well I must admit that in my first published results I was a little hazy
- even myself as to what I was aiming at. I only got into dhrystone testing
as I was trying to determine just how good the PAK3 was. My next set of
results will be clearer on this.

> the problem i see is that people interpreting results have a tendency
> to latch onto a single number. it would, therefore, be inadequate
> to state that the dhrystone rating of system A is X and system B is
> Y, etc, based on your method (though i would suspect that GCC would
> be about as close as you could get to maximum performance via a

This is always the problem - as it would be *nice* if dhrystone tests were
comparible across platforms. I've always known this problem though, even
if I've sometimes tended to 'forget' it However if I do compare tests
across platforms then I can only conclude Ataris are very slow. Eg I
recompiled my stock dhrystone on a 486SX2-50 under linux using GCC (2.5.8
instead of 2.3.3) but all the same flags. On a TT this produces a result
of about 5000. On the PC I got a result of 50000. Now the PC is faster
than the TT, but not truely 10 times as fast! Either the compiler is making
a big difference or the 8K primary or 256K secondary cache is responsible.
Anyhow I wouldn't want people to think the TT is 10 times slower than a
pretty averagely speced PC ;-)

> compiler). i do not know what impact compiling for 68030 via GCC would
> have on systems with 68030s, however, so i cannot state how far off
> your test might be (if someone were to use it as a sole metric).

I intend to recompile for a 68030 and do some tests with that. They will
be clearly marked though.

> you should also know that dhrystone v1 vs dhrystone v2 can give about
> a 2x difference in results, on the same system, with the same

I knew about this - but considered it not a problem as I was using the same
binary in all cases.

> also note that dhrystone ratings are still quoted by many vendors
> (mostly in the workstation market).

Yes I've noticed this. Makes it all the more tempting to do cross platform tests.

AFAIK you have a choice between KA9Q and MiNT-Net. IMO KA9Q is much
easier to set up than MiNT-Net, though not nearly as comprehensive. I've
only use KA9Q between 2 Ataris or an Atari and a PC - I didn't find it
that hard to set up. There has been some talk here of KA9Q distributions for
demon internet and the like. These might be more suitable for you if you
haven't tried them already.

I must admit I've never heard of any jumpering on 50 pin SCSI cables. I've made 2, one for a ICD host adaptor and one for a PC (Adaptec 1540B). Both were to connect up a NEC SCSI1 CD-ROM, though the ICD cable had a second connector for a Seagate ST1280N SCSI2 drive. Both cables are just 50 way ribbon cable with crimped 50way centronics plugs on either end. Both work perfectly as well.

Looking at my NEC SCSI 1 technical reference I see that pins 1 to 25 should be ground - *except* for pin 13 which is marked as open. I can see how jumpering them all might work - but OTOH pin 13 might cause a problem. OTOH again (3 hands here ;-) I see no *reason* to have to jumper them.

People will flame me for this - but you can get away with '*murder*' with SCSI termination as its all down to the tolerance of the components in the system. SCSI IDs are a different matter all together - you *must* get these right or it just plain won't work.

I've never worried overly about termination. Ie I do whatever I can to make the termination right, but I don't rush out to buy any terminators untill I've tried it. So far I've been lucky. haven't touched the termination on *any* of the SCSI untis I have, and the all work in what ever combination I've tried them. As it happens my termination is more or less correct at the moment - though its been pretty awful in the past.

I haven't seen OS/9 for years, but the last version I did see on the ST
is very unlikely to work with the Falcon. The differences in the 68030 are
very likely to throw it. AFAIK no other ST OS has worked on a 68030 without
first having to be rewritten to cope with it.

Be warned however, as many of these "SCSI" on the motherboards don't have the
BIOS to boot from that SCSI. You can use it to control post-boot devices,
but you'd still need a card to boot from a SCSI device. When looking for a
PC in June, there were No MBoards with SCSI built-in that could boot
from the SCSI. :P

From: carla@zikzak.apana.org.au
Message-ID: <3dl7db$1r9@lazar.apana.org.au>
Source record: 174046

Hi all,
is there a way to tell what version of TOS one happens to have in one's ST? Thing is, I had to get someone in Germany to send me German TOS ROMs for the second hand Atari I bought here in Australia (so I colud use my copy of Signum), and I don't know what version they were.
The latest update year named in the info box is 1989 and it does a reboot when I press that four-key combination.
I'm also a bit confused as I've read somewhere that what's referred to as TOS 1.4 is officially called 1.04, is this true?
Thanks for your help.

On my idea of making an SGI-type of system out of the Jaguar, I didn't mean for it to be a mass market thing.

I wanted it to be a cheaper alternative to the $100,000+ SGI machines... A cheap graphics workstation is all I want...

If a 3rd party were to be licensed to do this, it wouldn't cost Atari a penny... (now are there any 3rd parties interested?)

The market is already owned by Intel & compatibles... There's no sense in going for this home & office computer market.

To make it with an original design, you need a niche...

That is exactly the problem. The BIOS often lacks the required SDMS-support
(SCSI Device Management Software). But if you're lucky, you might get an
update for that BIOS. Mostly they're in FlashEPROMs so installing shouldn't be
a problem.

R > it. I've also mangaged to scramble disk this way. I never
R > upgraded from TOS 1.0 myself so I have the same problem.

And if you format your disks with Kobold, they'll be recognized by MSDOS. And a Macintosh on which Access PC is installed will accept them too.
In theory, disks formated on the desktop with new TOS are accepted by MSDOS0. In reality, I've found many cases where a PC didn't accept them (720 Kb) and, to exchange files with a Mac, I was obliged to format on the Mac in MSDOS mode (Access PC).

Now I format the 720 Kb with Kobold, and there's no problem with PC or Mac. In the format by Kobold, the first seven bytes of the first sector are always the same. Perhaps it's the reason, I don't know. But what I know is that format with Kobold works with other machines.

Hi John !
That was a very good info-post, and am sure a lot of people will be helped with that information. I hope that it finds its way into the CDROM.FAQ to be properly 'saved'. I have given advise and info to other people setting up scsi drives, and I have to wonder if some of those 'wont work at all' setups are as a result of this jumpering of 1-25 on the ribbon cable [ie on certain makes of drives] ?? Or am I off base on this? Reliable info would be appreciated. Also, would this be the kind of situation which does not allow other kinds of scsi devices to be used on a ADScsi - ie scanners and ethernet adapters etc. WHAT is the difference between the TT SCSI bus and a ADSCSI bus?

Thanks again! Jon

: Do you always build your opinion on things stated in mags?

Are you for real? or dont you understand english too well!!!! If 3
magazines rate an application very highly, dont you think that means
it is worth buying. Unfortunately, i took that chance on the recomendations
of these magazines, and i have found the program to be totally useless
when it comes to running the stuff that i most commonly use. Now just
to say it once again.... Calamus 1.09, Calamus SL, Notator SL, Cubase 3.1
do not like MagiC at all!!! verstehen sie? Ok, also I have found
that DAVEKTOR PRO is also a little bit suspect. A friend of mine states
that STFAX 2.1 does not like it either. Also Freeze Dried Term does not
like it, but i put that down to the fact that it is a non Gem .prg

: >the problems i have found, then i might change my mind. BUT IF YOU CANT!!
: >then as far as i'm concerned, the program is a DOG!!!!

: What problems? Until now I only heard you laming around. Nothing constructive
: so far.

It's a bit hard to be constructive when one has wasted their money.
I should have followed the original advice i was given and purchased
GENEVA instead. AT LEAST IT WORKS!!!!!

Is it possible to make Hermes (UUCICO) use 38.4 Kbps instead
of 19.2 Kbps? Both me and my UUCP-provider have V.34-modems, and
since I`m paying a LOT of money per minute it would nice to
cut down on the online-time.

Any help would be appreciated!

A good way to determine the power of a setup is to compare i. e. a TeX-run.

Mostly people use the LKURZ to compare machines. A PAK with FASTRAM really
flies. Way faster than a TT.

Message-ID: <3dmllc$fc6@osiris.wu-wien.ac.at>
Source record: 174056

The incompatibility problems with programs regarding Magic are due to the fact, that these programs have not been written with a multitasking environment in mind, and most of them do not use the system calls properly. This can be also seen on the Macintosh, for expmple (just take a look how many programs did work under system 6 and did not work under system 7). If you still wat to run those programs with Magic, use the single tasking mode and many other of the flags you can select (i.e., for exmpale "smart redraw" etc.....). In single tasking mode you can get almost *ANY* program to work, and the flags can help you with those programs, that do not work properly.

As to Clamus sl:
The patch (calapat.prg) is for 1.09 only. The problem of the SL version lies in the PKS editor, which is a really badly written piece of software (every Calamus user will tell you that). How to solve the problems (not only with Magic, but with all of the deficiancies of PKS Write):
a) Wait for "eddie", a new ASCII editor from AS (adequate systems) for Calamus SL
b) Use Calamus SL 93 instead of Calamus SL 94 with PKS Write (seems to be more stable....)
c) Use Calamus in Single Tasking mode

As to MIDI applications:
MIDI applications have mostly not been written with a mukltitasking system in mind. Even if these apps seem to run, they will eventually get timing problems. This should be especially true for GENEVA, the cooperative multitasking of which does not allow for MIDI applications to get the timing right all the time (depending on the other tasks that are running). So be careful.

As to Magic for Falcon
Magic for Falcon is definitely worked on. It is not true that Magic for Mac has alredy been officially released. The released version is *public alpha* for testing purposes. Magic for Falcon will be called Magic 3, and is the same for all other Atari computers (also for Falcon). It will be released a t the same time together with Magic for Mac at the end of January. Magic 3 will incorporate not only enhancements in terms ofthe AES (such as Geneva does), but also in the file systems. (i.e. several programs can access a drive at the same time etc...) Right now, if a programm access the harddrive, all other programs are not allowed to access it, too. Other enhancements will be loadable filesystems (i.e. for exoample direct use of Mac partitions with long file names etc...), loadabele device drivers (for the serial drivers there will be most of the HSMODA featuers integrated...), Pipes, drag&drop, Iconify.......

as to "magic is a hack" and so on and so on.....

Magic is a fully rewritten operating system for Macintosh and Atari computers (well, on the mac one could consieder it systm extension...) The worst buy I made was to buy MultiTOS from Atari, where people say "from Atari itsself it is a standard, not a hack". 8 years of Atari system software
develoment have resulted in a completely unusable, unstable and slow operating system. Menu response is slow, soemtimes the mouse disappears, the menus cannot be selected and it crashes and crashes and crashes. If it is compatible to anything, that has to be a programming maistake , because there is little that runs coherently for a longer amount of time (well, MinT is much better and deserves better treatment, but on the other hand it was developed ouside Atari). Dooes it run the MIDI apps, BTW? (just a joke :-)).So,IMO, the *real* hackers were John and his 12 musqueteers at Atari, Behne& Behne&Kromke&Tempelmann, on the other hand, have always produced excellent software.

In 95, IMO, Magic3 will become the successor of TOS. On the low-level side, ther will be still MinT, to which Magic has to orientate. But for all other operating system parts, it will be Magic that will set the standards for new system calls, documentation etc...(well, hopefully, GENEVA and MAGIC programmers will work together on the AES side to keep the calls comaptible).
And this is *GOOD* news, BTW.

Regards,

Alfred

: EM> Gopher (the preferred method) to gopher.archive.umich.edu and do the same.

: How do you use the FTP sites?

That sort of depends on the way you access the Internet. If you get on it
through a dedicated Unix server, then just either type
"ftp atari.archive.umich.edu" at the Unix command prompt, or just type
"ftp" and then once in FTP type "open atari.archive.umich.edu"
Once connected, enter your name as "anonymous" and give your E-Mail address
as your password.

If using Gopher (the preferred method, as Atari Archive is very busy and you
may not get on most of the time) then from the Unix command prompt, type
"gopher gopher.archive.umich.edu" and then when connected, move the cursor
down to option 6 (or just press 6) in "Merit Software Archives" and go into
Atari (option 4) then select the directory and the file yuo want.

If you're not using Unix, however, I suggest you talk to your system
administrator about how to go about accessing these programs.

Well time to try and raise some money...reasonable offers considered, as are trades for PC stuff (just in case anybody gives a hoot I am keeping most of my games and two complete ST systems). Shipping and COD charges go to the buyer.

ST software for sale:
Word-Up v3.0 $15
Redacteur v3.0 $30
That's Write v3.0 $35
First Graph $20
K-Spread v4 $25
Flash v2.0 $20
TKR Tele-Office fax program $30
PageStream v2.0 $30
Calamus v1.09 plus Calamus Guide(book) $50
Fontkit Plus v3.0 $15
Geneva $20
Multi-TOS $15
Fontz $5
Multi-desk $10
Neochrome $5
Degas Elite $10
Sketch hi-res paint program $10
Wordwriter $10
Data Manager $15
Cyber CAD set (incls CAD 3D v2, Cyber-Control and Cyber-Sculpt) $30
GFA Basic $25
Mark Williams C $25
VIP Professional $10
G+ Plus $10
Populous (version doesn't work on STE) $10
Civilization $15
Street Fighter $10
Quick ST v2.0 $5
Shadow (for Flash 1.6) $5

ST Hardware for sale:
Touch-Up and Monochrome Hand Scanner $45
Gravis Mouse-Stick $40
Stereo Master sampling cartridge $40
Spectre GCR cartridge w/MAC 128k ROMS w/Big Mac Secrets book (plus Mac OS disks) $125
Magic Sac cartridge w/MAC 64k ROMS $30
Atari mouse $5
StarSync Multi-Sync monitor box $35

Joystick accelerator $5
ICD Link SCSI adapter $75
Atari SM124 Monochrome Monitor $75

please reply here or via e-mail (dirk.vandenheuvel@nezuld.com)

What's the point? Do a simple hardware mod and increase serial port
speed to 38,400, connect to a 28.8 bbs and download - cps rates of about
3,400 cps are just that bit better than 14.4 connects, are they not? I
run a USR 28.8 on my STe after installing the port mod and it's a hell
of a lot faster than a 14.4 connect, I can tell you :-)

5948. WANTED: Atari monochrome monitor

Newsgroup: comp.sys.atari.st
Date: 1994-12-26 16:43:08 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.MQvTFdpfzqg@semprini.waterloo-rdp.on.ca>
Source record: 174062
Cross-posted to: kw.forsale,comp.sys.atari.st,uw.sys.atari

I'd like to replace my *sob* dead Atari SM124 monochrome monitor for a reasonable price.

Please email me if you've got one you'd like to unload. Be gentle though, it's just after Christmas!

Alternatively, I could probably get my monochrome monitor repaired, but it'd probably cost as much as replacing it with another used one. If anyone knows of a place that still repairs Atari equipment, I'd love to hear about it.

As far as I know, the SM124 is an OEM monitor built originally by Goldstar; it's basically a paper-white EGA with a non-standard connector. They quite often lose capacitors (this one did that earlier this year) and have power supply problems. The monitor died one day when I turned it on; no picture, and the power-indicator LED comes on about half as bright as it used to. No smoke, no smell, no apparently dead components inside (but then again, I have almost no clue when it comes to electronics). Probably a power supply problem, but I'm definitely in no position to investigate it or repair it myself.

Source record: 173982

In <Pine.ULT.3.91.941223043600.25164J-100000@acf2.NYU.EDU>, Kevin Dolorico writes:
>
>I was looking at the current computer situation in the world right now
>and all I saw really was Apple and "Intel"...and Microsoft. Apple, had
>been in the process of dying(until the the recent Pentium fiasco---now
>they have a chance to dig into the market again!)

What?!? Have you lost your mind? Sure, Apple's management does some
pretty bizarre things, but it's never been in the process of dying.
Atari was definitely in the process of dying, until they released the
Jaguar.

>I heard that in the next few years, there is going to be ONE OS running
>on all machines... a "standard"... This got me frightened! Are people
>going to be whitewashed and see everything in one color? It might be true!

You're a little mis-guided. The future appears to be that *any* OS will
be able to run on *any* hardware. *Any* expansion card will be able to
run on *any* system (via PCI and OpenFirmware/OpenBoot). ie, it'll be
the way it should have been in the first place.

>So... I have a suggestion for computer designers/hackers/or even ATARI...
>Why doesn't Atari make a computer based around... THE JAGUAR's chipset?

Because if Atari enters the computer market again, they'll go bankrupt.
Who'd develop software to take advantage of the system, or even to run
on it? Atari's having a bit of a hard time finding developers for the
Jaguar after the way they treated their ST/TT/Falcon developers.

>Given its specs, I'd say that if you added more ram(8 megs+), it would
>have more firepower than the current computer offerings. Port over a
>version of Unix, and then you're rolling...

On a 13.3Mhz 68000? The system would be slower than a MegaSTe, except
for graphics and sound operations. "Real" computing would crawl,
especailly with a multiuser system like UNIX on it.

>I'm sure there are people out there that are SICK of seeing "Intel
>Inside" and "PowerPC" logos... they want something more along the lines
>of a cheap SGI... Perhaps there could be a market for such a machine.

There certainly would be; witness all the Linux systems. Cheap UNIX
workstations is a surprisingly large market that's still being ignored.

>Given Atari's current financial problems just trying to market the
>Jaguar(poorly, as it seems)... perhaps it would be within their best
>interests to license off the design to some company to DEVELOP this

>Jaguar-Based RISC computer.

It'd be much, much better to have someone develop a Jaguar PCI card with
an OpenBoot BIOS.

>What do they have to lose? It certainly wouldn't hurt them...

Atari has this thing where they feel they must absolutely control all of
their technology, and prevent outside "stuff" from working with their
"stuff". Witness the lack of desire to build a CD-I cartridge for use
with the Jaguar CD-ROM...

>And just so I don't seem like an Atari fanatic---why doesn't Sega do this
>either with their new Saturn-based technology?

Sega certainly isn't stupid enough to try to enter the personal computer
industry.

From: ay973@FreeNet.Carleton.CA
Message-ID: <D1FnFr.GKs@freenet.carleton.ca>
Source record: 174071

my 520STfm seems to give a fuzy picture when hooked up to a low res monitor.

the monitor works fine when hooked up to my vcr.
i have also plugged in a tv which also goes fuzy . its fuzy to the point that
i cannot read small words.
i'm using a cable from a nintendo video game to tv cable and i have also used
a straight rca or phono cable with no results.

the monitor i'm using is a commodore 1701 colour with video in and audio in in
front and chroma and luma in's and audio in back with a switch for front or back.

is there a special cord i need or is there an ajustment on the ST to ajust it.
it seems like there is interferance or the tuning is off but i know it's not
due to the fact that it works perfectly with the vcr.

there is a setting on the ST next to the low out saying channel L H what do these
settings mean?

i saw an atari compatable hard drive used 20nmegs for sale for $100. is this what it's
worth?
can i make an IDE or seagate or ibm type hard drive work with my ST?
can ibm simms be made to work with my ST?

TIA

Perhaps you've misread the mags ...

>to say it once again.... Calamus 1.09, Calamus SL, Notator SL, Cubase 3.1
>do not like MagiC at all!!! verstehen sie? Ok, also I have found

Not Mag!C's faults at all. For one of the Calamus-versions a patch is
available. The major problem is the buggy PKS-editor which is in no means
supported and developed any longer.

>that DAVEKTOR PRO is also a little bit suspect. A friend of mine states

Most DA's products have more or less bugs. The DA crew knows about them but
they don't give a diddly poop about it.

I doubt that your MIDI-stuff works all that great together under Geneva. The
task-switching is probably not fast enough for the tight midi-timing.

5956. Latest version of Hermes, where?

Newsgroup: comp.sys.atari.st
Date: 1994-12-26 21:00:16 UTC
From: root@icon.pp.se
Message-ID: <H.ekBL.LwkWpFIYI3g@icon.pp.se>
Source record: 174072

I`m looking for the latest version of Hermes (v1.15?). I`ve looked through a couple of FTP-sites, but the best I`ve come up with is v1.14 so far. Does anyone know if v1.15 is publicly available, and if so where?

Thanks in advance!

: copy of Signum), and I don't know what version they were.
: The latest update year named in the info box is 1989 and it does a reboot
: when I press that four-key combination.
: I'm also a bit confused as I've read somewhere that what's referred to as
: TOS 1.4 is officially called 1.04, is this true?
: Thanks for your help.

Yes, there is. Easiest way is to grab a copy of SYSINFO, which gives you
any information you'd ever want about your ST... (well, almost, it
doesn't provide a benchmark).
I think it is available on almost any FTP-site, and has got a filename
like SYSINFxx.lzh/zip/zrc/whatever, where xx is the version number (8.3
is the most recent I've seen, but I haven't looked for a long time).

keyboard-reset is only available from TOS 1.4 and on AFAIK.

Yes, TOS 1.4's official name is 1.04, but ppl, lazy as ppl tend to be,
has in time "shortened" that to 1.4.
You'll find that 1.04 isn't the only TOS that ppl has "shortened".
TOS 1.02/1.0/1.06/1.062/2.05/2.06/etc all has lost the 0 along the way.

Regards, Tommy

AFAIK there is no GEM based WWW browser... yet. Though two are being written.

> I just saw the latest version of Netscape for the PC's, in action....

In that case, set up MiNT, MiNTOS, MiNTnet and lynx (all available on a.a.)
I used it for the first time yesterday. It's text based, but it works fine.

Try Mountain Reader II from Mountain Software, only $20 until Dec. 31 94,
very close to shareware price. It is very, very good and does both qwk
and bluewave. It is also packet with all kinds of features that can't be
found in any other qwk mail reader on the Atari platform.

>adapters etc. WHAT is the difference between the TT SCSI bus and a ADSCSI

TT and Falcon SCSI is a "real" SCSI-II bus capable of doing things a 'SCSI via
ACSI`-bus isn't capable of.

I. E. bus arbitration. That's a mode all newer an bigger drives (mostly in
access of 1 gig) require. Furthermore TT/Falcon-SCSI is capable of all
command-sets.

However, ICD introduced a "cheat"-mode to send longer commands with their
adaptors, and so you can use audio-commands as well. Usually audio is SCSI-II.

It is possible to connect Falcon's and TT's through the SCSI-port if you have
a driver capable of bus-arbitration. AFAIK only the latest versions of
HDDRIVER and HuSHI (6.08) support this mode. You could even connect to a PC's
SCSI-adaptor and build a pretty fast network ;-)

This won't work with ACSI.

Cheers

What are the modifications you have to make? I want to buy a 14.4K soon
and if I can get a 28.8 instead (and run it at more than 19.2K) that would
be great. Does the Falcon support 28.8K modems without any mods?

The internal VT52 emulator is of little value nowadays. The serial port
will do 19200 happilly so anything up to a V32bis modem is worth having.
The connector is wired just like an IBM PC serial port so just buy a PC
cable.

The ST can also read PC 720K 3.5" floppies so get some Atari comms software
onto that format and you will be fine (I'm not the best person to advise
on Atari comms software - but there are lots of experts around here).

> I'm a fairly cabable Internet Navigator and have read all the atari
> newsgroups, browsed atari web sites, done veronica searches, and

Two good FTP sites are:

atari.archive.umich.edu
micros.hensa.ac.uk

> browsed ftp sites looking for stuff for the 520ST. I haven't turned
> up *anything*. Everything is aimed at MegaSTs or Falcons.

The MegaST is essentially a recased 520ST with more memory. 99% of software
for MegaSTs will work on 520STs. The Falcon is the ST replacement - that
runs most ST software. There is also the TT which is the workstation
equivilent of the ST. More powerful than the Falcon, but more expensive
- and doesn't have all the neat sound/graphics hardware the Falcon has.

> particularly on the processors, hard drives, floppies, and other sub-
> systems of each.

STs and MegaSTs have 8Mz 68000s, Falcons 16Mhz 68030 and TTs 32Mhz 68030.
All machine will take hard disks. Mainly through the use of a SCSI host
adaptor which fits on the DMA/ASCI port. The Falcon and the TT have
seperate SCSI ports. IDE drives are possible too - though very uncommon.

STs and MSTs have 720K floppy drives. Falcons and TTs generally have 1.44Mb
floppies though a few machines were shipped with 720K drives.

Hope that helps a little. There is loads more I could say on the subject
:-)

Roland.

But not so easy to do when you can't get your hands on all the machines.
Also each TeX-run would have to be with exactly the same setup to ba of
any use.

> Mostly people use the LKURZ to compare machines. A PAK with FASTRAM
> really flies. Way faster than a TT.

Not heard of LKURZ, but then again I've not heard of lots of decent Atari
software.

I agree the PAK3 with FASTRAM is faster than the TT, but when I was
considering buying the PAK3 I was none too convinced the PAK FASTRAM would
actually ever get released. A PAK *without* FASTRAM is not nearly as fast
as some people would have you believe. Also in my case I had a MSTE which
I was going to upgrade with a PAK. In the end I reckoned that selling the
MSTE and buying a TT was a better bet. True the MSTE with PAK with FASTRAM
is *faster*, but it was also going to be *more* expensive than a decent
secondhand TT. Also now I have the TT, I wouldn't want to give up the
TT-Hi (1280x960) paper white monitor.

:-)

Yea yea.. Christmas time is over, stop wishing.
I'll believe in it when i see it, not a second before. I've heard plenty
of promises (even that Magic was suppose to be released for the Falcon
a few months ago. They only needed to finish the manual).
As for the Mac version, at least they got something.

Jon,

Thanks for your kind words about my post. :) I _wish_ I knew enough about SCSI to answer all your questions (sigh). Reliable info would be _very much_ appreciated, by both of us and all the other folks here too! I know of 3 people using the Toshiba CD-ROM drive, myself on a Link 1, Marty O'Bryan on an ADSCSI adaptor and one of my fellow Delphi members on the SCSI port of his TT directly. All the configurations work, but as far as I know, I was the only one who had to use a pass-through (non-SCSI) cable to make it function. If anyone can tell me/us why, I'd be very grateful. I am sure that at least _some_ of the 'won't work at all' setups asre being taken down by just such a problem as I had. But why does it work that way????

Not many phone lines will run at 28.8 and many shops here in NZ state
that NZ phone lines will not work at that rate...

Go have a look at the problems that most people get with 28.8 modems,
go sub to comp.dcom.modems...

I have not had much luck calling out side NZ with a 14.4 modem, and German
sites seem to be a real pain...

NOTE: Don't go buying the none standard Vfast 28.8, stick to the real
V34, also note a lot of V34 modems will not talk to Vfast ones....

Message-ID: <3dov66$s47@golem.wcc.govt.nz>
Source record: 174094
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well The New Port of JPEG5 on A.A. is very very buged,
the file that I used with JPEG 4, comes out OK a 250k GIF
File, but the file from JPEG5 doses not work and comes
out as a 10meg file..??

We should have soon a Real Atari port of JPEG5A, these other ports are not ment
for Atari, no TTP help files and no memory check, the JPEG4 does support all
that, but will not find files when run from a folder...

Come on chaps less of this crap, if you are not a Atari user, Please don't port
stuff that you can't test, and is not configured for the Atari platform..!!

So both JPEG5 ports are Buged, the one on A.A and the other on tu-berlin...

Or is it the source code that is buged...??

That is correct.

>Not heard of LKURZ, but then again I've not heard of lots of decent Atari

Thats a certain TeX-file all TeXnians ought to have.

>I agree the PAK3 with FASTRAM is faster than the TT, but when I was
>considering buying the PAK3 I was none too convinced the PAK FASTRAM would
>actually ever get released. A PAK *without* FASTRAM is not nearly as fast

That depends on the clockrate you're running. At 60MHz it is fast even without fast-RAM. In addition one can install the modification for the motherboard as well. That gives you 10, 12, or even more MHz on the main PCB.

This results in an overall performance improvement. DMA gets way faster, and with a modified OverScan software you have really nice resolutions in _all_ modes. Even mid-rez becomes usable.

Did Vic publish the photos and other data he took in Hennef? I talked to him when he showed up at the MW-booth to compile some infos about the PAK and stuff. He seemed pretty amazed ;-)

>is *faster*, but it was also going to be *more* expensive than a decent
>secondhand TT. Also now I have the TT, I wouldn't want to give up the TT-Hi
>(1280x960) paper white monitor.

Ok, TT-high is really nice. Thats one big advantage.

: Yea yea.. Christmas time is over, stop wishing.
: I'll believe in it when i see it, not a second before. I've heard plenty
: of promises (even that Magic was suppose to be released for the Falcon
: a few months ago. They only needed to finish the manual).
: As for the Mac version, at least they got something.

I *SAW* it. On the ProTOS show, it was not only running as a replcement
for TOS at the stand of ASH (who distribute it) but also at the stand of
the competition (No! Softawre, Compo.....) - and it seems to be very stable.
There has not been any announcement telling about a release by Christmas;
and there was no official announcement concerning Magic for Falcon as
well (at least not with the manual finishing- the official version said
that delays are there because of NVDI 3).
Of course, it would have been better if they would have finished it
yesterday, but when it cojmes out then, I think you will like it nonetheless.
On the other hand, you can still wait for Atari to release a nw MultiTOS
version :-)

Regards,

Alfred

A Falcon gives you enough speed on the additional serial ports. One should
only install HSMODEM to make things work really well.

On my MegaSTE I've set Modem2 to a DTE of 57k6 which is definetely enough for
a 14k4 modem even with unpacked stuff.

If you connect a V.34 modem a DTE of at least 76k8 or more would be
appropriate to take full advantage of the modem (again, with _unpacked_
stuff). If the serial port is only capable of 19k2 a V.34-model would be a
waste of money (IMHO).

: Yeah, great. You stup*d bonehead. I probably understand English way better
: than you would get along with German.

Ok ok, enuf of the abuse. I dont have the time nor the patience for it.
(I lived and worked in a town called Celle in '81 btw, so my deutche sprechen
is reasonable)

: Perhaps you've misread the mags ...

Not at all, if you've read them, you would notice that the reports for
MagiC are glowing.

: Not Mag!C's faults at all. For one of the Calamus-versions a patch is
: available. The major problem is the buggy PKS-editor which is in no means
: supported and developed any longer.

that may be so, but i'm stuck with PKS (and i hate it also btw)

: Most DA's products have more or less bugs. The DA crew knows about them but
: they don't give a diddly poop about it.

well i'm quite happy with the DA stuff except for one thing, and
unfortunately that is because i dont use the colour version of Didot
(or whatever it is called now) which enables filled vector graphics
to be saved blah blah.........

: I doubt that your MIDI-stuff works all that great together under Geneva. The
: task-switching is probably not fast enough for the tight midi-timing.

Perhaps not, but i would like the luxury (especially with Notator) of
being able to adjust the score while d/ling from a bbs or editing
a graphic in calamus.

It may be a lot to ask, but it is what I would expect from a multitasking
program. Perhaps i expect too much (especially after what i have read).

I SUGGEST THAT YOU READ THE MAGAZINE ARTICLES IN QUESTION THEN YOU WILL
KNOW WHAT I MEAN. 8-)

and please, no more abuse, everyone else who has replied has been quite
reasonable in their opinions.

DB> support to Apex .have you had a chance to speak to Rombo about this
DB> (availability of
DB> source code which they say to me they are happy to release to anyone
DB> who want
DB> it) ? And probably more to the point is it feasible given its
DB> relatively low
DB> spec point ?

Nope, sorry - have not had the time yet, but I'll give them a ring next week.
The only hassle I can forsee is that Vidi12 does not generate a true-colour
image. This means a bit of additional image-conversion which although easy,
does not comply with the way the program works just now. You will not be able
to grab truecolour animations in realtime etc. but I imagine thats pretty
obvious anyway.

DB> Anyway apart from that I am having lots of Fun messing about with
DB> Apex anyway ,

Great, glad you are having fun with it!

DB> plenty to keep me occupied until Expose is available ,what is the
DB> current
DB> projected release date ATM for That ?

As far as I know (Expose is a Titan Designs project, BSS are only involved with
the software side), the card should be available early next year. i.e. February.

If you want a more accurate date, call Dave on 021 693 6669.

DB> larger page
DB> (640*400)than screen sized (320*200) image Apex locks up ,this is
DB> with Outside
DB> set to compatible ,RAM into ROM protected, and all other switch's
DB> OFF , IS this
DB> due to VRAM not liking to deal with screen display , although IIRC
DB> the same
DB> problem doesn't happen with GIF or TGA files .

Hmm, Outside does seem to have a few probs with the FileSelectors now and again, as well as other things.

To be honest though, if you only get problems with JPEG files then I think I know what the problem is - we use the Audio DMA to transfer the JPEG data to & from the DSP to give us a little more parallelism. This means the program can convert & process the pixels as they are
generated.

I think we have made the mistake of providing available 'virtual' memory to the JPEG routine for general use - the problem being that ALL
hardware, including BLITTER, AUDIO DMA, SCREEN DMA etc. cannot use virtual memory at all. The memory accessed by these chips does not go via the 68030 & therefore bypass the MMU which is doing all the 'virtual' stuff. This is why OUTSIDE allows you to leave some normal memory for the OS -it needs it for the hardware!

DB> What it the best
DB> settings you
DB> have found for Outside ?

For good all-round results, set the pagesize to 16k. This prevents exaggerated disk-thrashing (as with 8k) and is more efficiently managed than 32k. I think copying ROM to RAM might (don't quote me on this one) be a little unsafe, as it means the OS will start swapping in & out of RAM as the machine begins to use up more space. It's a little scary that a program calls a routine in the OS and it's on disk at the time! Generally, try to keep programs in ST memory by setting their flags - but let them ALLOCATE from VIRTUAL memory. This should be a much safer way to go.

Also, when you choose the amount of normal/alternative ram for use, always leave about 2megs of normal space. This is absolutely mandatory for Apex to be able to allocate screens. The value you enter as 'alternative' is simply the size of the cache you wish to use on the virtual disk - the bigger it is, the less disk-swapping you will have to put up with - but it is just a luxury & not highly important.

If you get out of memory problems, try making the alternative 'cache' smaller.

DB> And any hints for setting up the CPX (I
DB> have found it
DB> necessary to limit the amount of VRAM to be used else you cannot
DB> load or save
DB> files)

That's weird - I'll need to try it.

I use these settings > LEAVE 32k (ST-RAM) : LEAVE 1024k (VRAM)

Hope this helps...

Who can help with the game TOWERS?

I am in the two topmost levels of the tower. There is a great
room with a locked door (how can I open the door?) and some
switches (labeled A-H and 1-8). There is also a long tunnel with
a lot of magical traps. The tunnel is blocked with some rocks
(is there a way to pass the blocked tunnel?).

In the rest of the tower I found writings on the walls (for
example: E2-E4). I think these writings should help to
operate the switches, but unfortunately I don't know how.

Regards,
Alexander

Yep, i'd hear those excuses as well.

>Of course, it would have been better if they would have finished it
>yesterday, but when it cojmes out then, I think you will like it nonetheless.

It would have been better to support the Falcon before anything else.
Supporting the ST is something i do not understand at all. The ST is dead.
Supporting a Mac is something i can understand, but it doesn't leave many
hopes left for the Falcon.
Beeing more concerned about NVDI 3.0 rather than finishing Magic for the
Falcon, is another thing i don't understand. We allready had a working
NVDI for the Falcon. And there is probably more demands for Magic on the
Falcon, than a new NVDI, who is supporting SpedoGdos, or whatever the
new features are. NVDI was suppose to be a screenaccelrator, not some utility
for DTP handling.
So don't blame me for beeing negative about this. Blame the Magic team!

I hope i'll live to experience Magic for the Falcon, but to be honste i
really doubt it.

>On the other hand, you can still wait for Atari to release a nw MultiTOS
>version :-)
>

No thank you.. I do have MultiTos. It came with my Falcon, and now it
seems like i can't get rid of it 8-(Maybe if i gave it away for free.

Greets
Kim

> cut, paste and "send" from them?

That is probably because you are just clicking the available button selections on that popup dialog (the highest being 500 lines, if I remember correctly). Simply type a bigger number into that dialog and it takes it just fine. I have mine set to 1000 lines. As for the max, I really don't know. My guess would be however much memory you have available, but I don't know what the structure looks like in which the lines are buffered.

Now, with that said, I cannot admit to actually testing this to make sure it can save 1000 lines. I know that most of my sessions generate a far greater number than that, and I have not had any problems, but I have not actually counted to make sure there are a thousand there or anything :-). I assume it does work as it seems to.

I believe there was a game pack released that had both James Pond and Robocod
included. I'm pretty sure Robocod is still pretty easy to get, and the pack
might be as well (I hear Robocod is better than JP, as with many sequels).

One place to try is D&P Computer Supply, 1-800-535-4290. They can get just
about anything that is still made for the ST. Good luck!

AFAIK the ROMRAM option puts the OS into RAM, protects it and the memory used.
This part isn't swapped at all then.

But I'm not 100 % certain on this. Perhaps Uwe can comment on this one!?

Pretty technical group, though.

>NOTE: Don't go buying the none standard Vfast 28.8, stick to the real
>V34, also note a lot of V34 modems will not talk to Vfast ones....

You can buy a V.fast if you observe a couple of things:

-it should be a DSP-modem. NOT a chip-set one. With a DSP you can upgrade
easily with a new firmware.

-make sure the firmware is in FlashEPROM's. No hustle there to get a newer
version installed.

I personally won't go for this last analogue step towards higher speed. I'd
rather buy. (E)ISDN. That gives me 2 channels at 64kbit each for about the
same price of a decent V.34 (USR).

Source record: 173964

HI all.
Well, I guess I'm dumb, I tried to install the 680x0 linux vers. on
my falcon , it prooved to be quite impossible at this time since
the HD drivers are so buggy , it takes about 1-2 read attempts from
a (any) HD..both SCSI&IDE untill the system crashes, so be warned,
do not attempt to install LInux on a Falcon if you're not really really
sure you know what you're doing...
Anyhow, my problem is this, I Minix initialized a partition for use
with Linux (From linux with mkfs) and now I can't restore it.. :(
Any help ??? I seriously don't want to reformat the whole SCSI disk,
as I have in excess of 180 Mb's of stuff on it and it would take litterally
years to back it all up, and my IDE is only 85 Mb's... :(

Desperatly in need of advice,
-Peter.

] Not many phone lines will run at 28.8 and many shops here in NZ state
] that NZ phone lines will not work at that rate...

I've never seen any problems. I downloaded a 1.2meg ZIP-file with a
28.8K connect, (speed of around 4600cps average), without any problems
at all. (On a PC obviously)

] NOTE: Don't go buying the none standard Vfast 28.8, stick to the real
] V34, also note a lot of V34 modems will not talk to Vfast ones....

Is there actually any difference between the two, or are you paying
an extra $100 just for the "standard". No v.34 modem I've seen advertised
doesn't mention "compatible with V.Fast modems". There were rumors
of a new 8:1 compression for the v.34 modems, but as far as I can
see, the two are the same thing, (other than they apparently negotiate
the connection slightly differently).

I disagree... software optimized for the PPC should be much faster than the
same software written for an 040/060. It's the old CISC vs RISC bit again.

And this is a moot point anyway since no one will be able to afford a 68060
until (and IF) production increases to a point to make them affordable.

Hmmm, thought I mentioned before that I have NOT benchmarked this. It is based solely on my personal, daily experience with both machines. I need to d/l the latest version of Speedometer which is PPC compatible. I'll do so this week and share my findings, whatever they may be, OK?

>(I've also read that Apple has an improved emulator in-house, that
>tuns twice as fast, but is reluctant to release it because it might

Yes, Apple does have an improved emulator that is supposed to be released this spring with the new crop of PowerMacs. I think the rumor about their reluctance to release it is hogwash, however.

Don't believe everything you read, Mark. :) I'll do the benchmarks and send you the results, but even via my 'seat-of-the-pants' tests I can assure you that the PM7100/66 is in NO way 2 - 2.5x slower than my 32MHz 660av! Perhaps that MacWorld article referred to a 6100/60?

From: jchung@ren.us.itd.umich.edu
Message-ID: <3dqc4o$6ig@lastactionhero.rs.itd.umich.edu>
Source record: 173966

Hello, out there:

I recently got Populous II for my Ste and found that the game will not run with the Warp 9 Screen accelarator installed. Does anyone know of a fix out there that might correct the problem?

My setup is a 4 Meg Ste running TOS 1.62 with a hard drive.

Right now, to play the game I have to boot with a floppy which is really annoying.

6006. Atari STf & LDW Basic

Newsgroup: comp.sys.atari.st
Date: 1994-12-28 03:25:48 UTC
From: ad264@freenet.toronto.on.ca
Message-ID: <D1I471.I7x@torfree.net>
Source record: 173967

I have an Atari STf running under TOS 1.0. For a few years I have been writing programs using the LDW Basic compiler. The programs run well on my machine. However, when I tried them on STe and Mega systems, a few problems showed up. The main one is that a click on a button on a secondary window is not recognized. I tried recompiling on these machines and the same problem occurs.

Is the fault with LDW Basic, the Atari hardware, and is there any way around it ? I have also tried compiling with 1.4 on my machine, but that also doesn't help.

I would appreciate any help or suggestions.

Jack.

Use a boot-selector (Superboot, Hazel, Easyboot etc.) and disable Warp-9
upon bootup. Warp-9 isn't too friendly with a lot of programs that
use non-standard methods of doing things, such as most non-GEM
games. There should be a switch in Warp-9 itself to disable it
temporarily, but I could be wrong.

Running a hard-drive without a boot-selector is just asking for problems
to happen....

By far the best one is X-Boot 3 which Gribnif sells. This is however
commercial, and so costs more than the 3 I listed above :)

> would i be better off buying a better machine (mega tt or whatever)
> and what is the process to change the CHIPs?
>

All depends how comfortable you are with soldering.
The 520ST has two banks for RAM but only bank 1 has chips in it. The chips should be 256K each, and there should be 16 of them (each bank takes 16 chips). Now if you wanted to go to 1 meg theoretically all you'd need to do is fill up the second bank in the 520ST. Whether this really works I have still to find out. I'm trying to do what you're doing, upgrading a 520ST to 1 meg.

The other option for you when doing RAM upgrades is to get a pro to do the upgrade.

A neat little product that I found out about only recently is the Marpet Xtra-RAM board. It will allow you to put SIMM RAM into your ST instead of the old DRAM. SIMM RAM is great because when you want to upgrade to more RAM you just plug it in. The Marpet will let you go as high as 4 megs.

Hope this helps

>
A ha we meet again!

Okay first let me tell you about monitors. Even the best cable in the world won't save you from that fuzzy screen. The RF output from the ST is just plain bad for anything other than low rez. If you want a real composite output your going to have to get an ST monitor cable that has been modified for use with a composite monitor (like the 1701), that or else you should plunk the money down and get yourself a proper ST RGB monitor (known as a SC1224). The settings L H are just a channel select for the ST when using a television as a display terminal, it's not useful for much else. Your ST's manual should say pretty much the same thing.

An ATARI compatible hard dirve eh? Okay what was the make, how many years has the owner used it, have they had any problems with it (head crashes, drive controller failure, etc...), is the hard drive auto parking, what is the encoding method (MFM, RLL, IDE, SCSI)? These are all factors that you'll need to consider before you buy a hard drive. I suggest doing some reasearch on the subject before taking the plunge. Cost will depend on all the factors listed.

Well its a thing called Logic, there are far more ST.STE's, MEGA's out there
than Falcons....

Falcons don't sell, well they have had to drop them down to 300 pounds
in the UK to get rid of them...

A dealer here brought one in, he was told by a Falcon addict that he would sell
heaps, one year later it still in stock, unless he gives it away it will never
ever be sold...

This SwapMeet is Dated for January 2nd, 1995 at 7 PM.

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

Is currently holding Monthly Swap Meets with an occasional Raffle. Monthly Swap Meets are Held on the First Monday of each Month from 7 PM - 10 PM. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

FREE ADMISSIONFREE ADMISSION**FREE ADMISSION**FREE ADMISSION**

PLENTY OF FREE PARKINGEVERYONE WELCOME**PLENTY OF FREE PARKING**

FOR ANY INFO INCLUDING TABLES: CALL BEN AT (503)256-9974!!
THESE SWAP MEET SPONSORED BY ACE OF AMERICA!!

This Message is distributed throughout the Pacific NorthWest, everyone reading and their Brother is welcome to come and Attend!!

Please Direct all Replies to bensmith@teleport.com in E-Mail or call Ben anytime at (503)256-9974.

The next SwapMeet is Dated for January 2nd, 1995 at 7 PM.

>at all. (On a PC obviously)

I'd say this CPS-rate is bogus. With well _pre-packed_ stuff one should have a max. of about 3350 cps. With _unpacked_ files one should get in access of 7000 cps.

Of course to take advantage of the modem's capabilities the DTE-speed should at least be set to 57k6 with pre-packed and 76k8 or 115k2 with unpacked files.

>Is there actually any difference between the two, or are you paying
>an extra $100 just for the "standard". No v.34 modem I've seen advertised
>doesn't mention "compatible with V.Fast modems". There were rumors

Big difference. V.34 is a standard everyone has to stick to. V.fast is moreless vendor-specific. Some V.34 machines can connect to a V.fast, but that is not guaranteed.

>of a new 8:1 compression for the v.34 modems, but as far as I can

Sorry, but that's utter bullsh*t. Even the 4 times compression ratio is highly unrealistic. One should stick to the rates the usual packers e. g. ZIP or LZH provide. That's realistic.

>see, the two are the same thing, (other than they apparently negotiate
>the connection slightly differently).

They're really not the same. It's to technical for me to explain it in English, though. There are more appropriate groups to get details anyway.

V34 and VFast is two different protocols. They do not work together, (just
like you can't get Xmodem and Zmodem to work together).
V34 has been announce to be _the_ standard in the furture. So anything which
doesn't support V34, could become a problem. But right now there has been
sold alot of these Vfast modem, and most of the manufactures has promised
they'll make an upgrade to support V34 as well as VFast.
But if you plan to buy a new modem, buy a V34, just to make sure.

HM>

Thats not just your opinion, thats a fact. A V34 (or an 28k8 modem), should
not be set to anything below 57600 DTE baud, (well, 38400 should perhaps
be enough). Anythng below 38400 would be the same as connecting a 2400
baud modem with DTE baud of 1200. Stupid and surly waste of modem and money.

Well, I think you did well writing about the Acorn "Risk" machine . :-)
The acorn RISK machine is a realy good machine, IMO, but is terribly
outpwered by Apple Power MACs, Alphas and the likes. Apart from the UK
(And New Zealand?) they are absolutely anything else but widespread
(right now I cannot think even of one mag that is out for the machine
over here). And I do not think that the software base is any better than
the software base of the Ataris .

: >I *SAW* it. On the ProTOS show, it was not only running as a replcement

: It would have been better to support the Falcon before anything else.
: Supporting the ST is something i do not understand at all. The ST is dead.

Well, I have a Mega STE here and there are far more St(e)s and TTs out
there than there are Falcons, and I fo4r my part wnat to continue to use
my machine. I think supporting the ST and TT is also simpler to achieve,
as the original work has already been done on a ST.

: Supporting a Mac is something i can understand, but it doesn't leave many
: hopes left for the Falcon.

The hopes for the Falcon should and are not carried by ASH, the Behnes
but about Atari themselves.
And if those people at atari have already got prototypes of a falcon040,
running with some very interestin specs, as one atari techinician (former
atari technician) at the Texas facility told me, and then they decide not
releaseit, to close the Texas research center etc.. and concentrate on
gemas consoles, what more do you want?
I cannot say more that there magic for Flcon is definitely worked on, if
you believe it or not, the rest is up to Atari.

: Beeing more concerned about NVDI 3.0 rather than finishing Magic for the
: Falcon, is another thing i don't understand. We allready had a working
: NVDI for the Falcon. And there is probably more demands for Magic on the

There is an extremely high demand for NVDIO on all machines, and there is
also an extremely high demand for SpeedoGDOS and alikes of it. I think
that besides NVDI, SpedoGDOS 4.x was one of the mostly sold piece of
software over the past months. The problems with Atari software, howver,
are well known to developers and users, so there was enormous demand
for improvements inthat area, which, Atari, as always, ignored. At least
with Eric Smith we got the software officilly released. Now, after Compo
announced the availability of SpeedoGDOS 5, it should be clear that the
release of NVDI 3 with integrated vector scalers etc. was to be givn
priority in order not to lose customers to Compo.

: Falcon, than a new NVDI, who is supporting SpedoGdos, or whatever the
: new features are. NVDI was suppose to be a screenaccelrator, not some utility
: for DTP handling.

NVDI never was supposed to be just a screen accelerator (this is just the
rumours or opinions those guys who are close to Quick ST, Warp 9

etc..are spraeding).
NVDI is a full replacement for the graphic routines in GEM, called VDI.
The VDI handles not only screen output, but, as the name already states,
output to any devices (printers, plotters, cameras ...); it also includes
fonthandling. The reason, why fonthandling and device handling fo rdevices
other than screens have been separated on the Atari was that everything
just
did not fit into the ROMS of the early STs. Yet GDOS was always a part
of the VDI (just take a look at PC GEM).
Thus it is absolutely natural for a VDI replacement to use also Speedo
technology, device handling or anything else in that matter that has been
added to the VDI (or GDOS) in its course of development.

: So don't blame me for beeing negative about this. Blame the Magic team!
: I hope i'll live to experience Magic for the Falcon, but to be honste i
: really doubt it.

Well, some dreams come true. :-) I would not be surprised if 1 or 2 months
from now we will see a new Magic owner in denmark :-)

: >On the other hand, you can still wait for Atari to release a nw MultiTOS
: >version :-)
: >
: No thank you.. I do have MultiTos. It came with my Falcon, and now it
: seems like i can't get rid of it 8-(Maybe if i gave it away for free.

For free? I think you should give so. moeny to use it. IMO, format the
disks, and send a letter of congratlations to the former TOS crew at
Taligent for the extra empty disks for data storge they were able to
include with a Falcon.

Regards,

Alfred

> available somewhere?

I've been beta testing a viewer that handles .DL files as well as GIFs, FLIs, FLCs and a few other formats. It ONLY works in 256-color mode, however. The viewer was written by Mike Hill and is being released (apparently as freeware) as soon as he finishes the docs. It's the fastest FLI, FLC and GIF viewer I have used on my TT. It will be posted on GEnie shortly, and someone should pick it up there.

That is absolutely correct. The work on NVDI caused some delay. I think it was not the original plan to implement TrueType Fonts. But now NVDI is completed and works great (even with original MS Windows fonts).

We hope to finish MagiC 3 in a few weeks, including Falcon support and some additional MultiTOS features. MagiC 3 has a complete rewrite of DOS (it was necessary to implement device drivers, XFSs and MacIntosh support) and that's why it took some time.

How hard was this to set up ? I downloaded the latest binary of MiNT and then
found the latest version of MiNTnet but this wasn't compiled so it wasn't much
use to me.

To be honest, I've had very few compatibility problems wih either one,
but I don't use MIDI software. All of the major league stuff I've used
has run with MagiC with no problems at all, other than a UK soundtracker
called STormTracker, which likes Geneva but not Mag!X.

This is true. The new USRobotics Sportster V.34 is V.everything - it
does true v.34, v.fast, v.terbo etc right down to 300/300 without
trouble. I've used mine to connect to v.34 and v.fast modems with no
trouble.

This is one fine machine. The firmware still needs to be worked on, though.
And it's quite expensive IMO.

> use to me.

Are you sure? The distributions come with the source *and* the binaries. Don't
be fooled by the fact that they don't have .ttp or .tos as an extension. What
you'll need is MiNT (BTW is 1.12h2 available in binary form anywhere?) in the
auto folder, a mint folder on the boot partition containing socket.xdd (from
mintnet net/socket.xdd), the SLIP driver (net/drivers/slip.xif) and PLIP if
you want to do local ST to ST networking at any decent speed. Then just put
the configuration tools (tools/netstat, route, if*, slattach) somewhere, and
then just add the bits you need (ftp, lynx, telnet).
If you setup MiNTOS first, the directory structure is then created for you
and so you just put the bits of programs you get in the relevant places.
All in all it is a bit tricky, but worth it.

>Well its a thing called Logic, there are far more ST.STE's, MEGA's out there
>than Falcons....

Do you call it logic to support the ST, or even Atari ?
Maybe there are more ST, STE and Mega owners now, but they will not grow
at the market. There is a slight chance that the Falcon will take over
alot of those ST,STE owners out there, IF! people like the Magic team
had the time to support it.
Do you call it logic to support the ST and the Mac, but not the Falcon ?

>
>Falcons don't sell, well they have had to drop them down to 300 pounds
>in the UK to get rid of them...

Dropping 300 pounds from it's original price only shows the real price.
The Falcon was far to expencive when it first hit the market. Now it's
down to a place where it's a fair price.

>
>A dealer here brought one in, he was told by a Falcon addict that he would sell
>heaps, one year later it still in stock, unless he gives it away it will never
>ever be sold...

That dealer might been unlucky. On the other hand, he doesn't have much
Falcon stuff to sell either, which once again is cause by software producers
like the Magic team.

>
>A far better machine to get is a Acorn Risk PC, leaves all other machines for

From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <D1Js2o.Mq0@murdoch.acc.Virginia.EDU>
Source record: 173914

I made a stupid mistake the other day and put a clock radio down on top of my sc1224 monitor (the original RGB one with the dials on the side). Anyway when I turned on my computer today the screen was all rainbow tie-dyed. I moved the clock away that second and most of the color distortion is gone, but I still have a purple blotch in the top left corner of my screen. Does anybody know an easy way to fix this? A year ago a friend put a car stereo speaker on my TV set and the magnet distorted the screen so badly that it is still all funky. Hopefully any solution will help with that, too. Thanks in advance.

6047. 14.4K Modem w/Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-12-29 01:26:33 UTC
From: em129@cleveland.Freenet.Edu
Message-ID: <3dt389$ioa@usenet.INS.CWRU.Edu>
Source record: 173919

Hello Everyone:

I just bought a 14.4K Fax Modem and want to be sure that I'm getting the best use out of it that I can. First of all, my comm software has a mode for 9600 baud and 19200 baud--which should I use? Do I need some sort of AUTO folder program to fix the serial port on the Falcon in order to obtain high speed data transfers? Do I need a hardware fix? Also, are there any pd fax programs anyone could recommend for me to try out my modem's fax capabilities? I'm not technically inclined, so please answer in layman's term, where possible. Also, anyone know of a good kermit program that will run on the Falcon? Any advice on these matters will be greatly appreciated. Thanks for your time :)

You speak in serious Mis-Understatement Mode! Atari's having a DAMNED HARD time finding anyone to develop for the Jaguar. Witness "the list" of developers "on board" against the number of titles A FULL YEAR LATER!

Atari (the Tramiels...) couldn't market their way out of a wet paper bag. This year I have had recurring notions to re-write the Christmas classic "T'was the night AFTER Christmas"

>Backwards-compatibility is crippling the computer industry in the 90's.

If you want to see some REAL steps backward, take a look at the PC platform! These people are just now figuring out that everything they install on their system scrambles their CONFIG.SYS and AUTOEXEC.BAT files, so they're not using floppies to boot various games and software packages! IT'S THE 90'S, FOLKS! And the PC crowd is just now stepping up to BOOTING FROM FLOPPIES!

And now, for your Atari-bashing pleasure:

T'was The Night After Christmas
==========

T'was the night after Christmas
and all through the house
Children were screaming and shouting,
"That Sam's such a louse!"

I have harsher words
I use for Ol' Hairless
"Lying Twit" and "Laughing Stock"
Slip out when I'm careless.

"He promised us 30 games!"
'They'll be out by year-end.'
The children would love
To kick his rear-end.

I must now throw in
A lineend "Tramiel."
It's the only thing I know
That rhymes with "Schlamiel."

It 'sounds' to me like what you have isn't an AU file at all. Every AU file
I've gotten has converted perfectly with 525 ... and if 525 doesn't convert
it properly, then chances are it isn't any format 525 recognises.

The first few bytes of the file are .snd !!!
is this not a AU file...

525 list it as a mono 16 bit u-LAW signed SND file....

I saved it as a 16 bit mono AVR file...

Is there some thing that I am doing wrong...

6057. Mapping Joystick/Mouse Port 1 to Joystick Port 2

Newsgroup: comp.sys.atari.st
Date: 1994-12-29 08:48:52 UTC
From: mparrott@pnw.net
Message-ID: <3dtt5k$gl9@cascade.pnw.net>
Source record: 173925

Does anyone know if a program exists that can map things so that Joystick port 2 can be used as the mouse port? I've got a computer desk with a keyboard support, and the MegaSTE/TT keyboard sits too far to the left for comfortable typing when the mouse is plugged in to Joystick/Mouse port 2. If I could just plug the mouse in on the /left/ side of the keyboard, life would be grand. :) And I'd rather do this via software, if possible, as opposed to hacking the keyboard apart to jostle connections about.

If you happen to know of such a beast as a program that allows remapping the Joystick/Mouse port(s), please be so kind as to let me know either in this group (so ALL of us know) or via e-mail (if you're shy).

My sincerest appreciation,

- -

>Do I have to go get a PC clone and a SoundBlaster...??

I have played all .au's I got from the net without problems on my
Falcon using Winrec 1.371. 525 is made by same programmers so I
suppose it should work too. You might have a defective file.
2.0 is the latest version of 525.

6059. strn for MiNT/MiNTnet

Newsgroup: comp.sys.atari.st
Date: 1994-12-29 10:57:58 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <788698678snz@bigbox.demon.co.uk>
Source record: 173874

I have just grabbed strn.tgz from atari archive, but there seems to be no docs concerning the ST port and no mention of who ported it. Can anyone tell me who ported it or answer a few questions?

1) nntp-inews - what exactly does it do? I know it is an nntp program for MiNTnet, but does it just post articles or can it recieve them too? Is there a server side to it for the ST? How do you configure which newsgroups it grabs (if it can recieve news)?
2) Is it possible to set strn up so that local newsgroups are posted to immediately? For example if I want a local newsgroup called vp.announce?
3) How do you persuade strn to find news in a news group? I have tried putting files in the /usr/spool/news/... structure but with no success.

Thanks.

19200 baud is the correct setting (RTS/CTS is also needed for high speed)

>Do I need some sort of AUTO folder program to fix the serial port on the
>Falcon in order to obtain high speed data transfers? Do I need a
>hardware fix?

My USR 14.4K works fine without any AUTO-programs or fixes. I think
the fixes are needed for 28.8K speeds.

>Also, are there any pd fax programs anyone could
>recommend for me to try out my modem's fax capabilities?

ComaFax is a german shareware FAX-program (with a messy interface though..)

>Also, anyone know of a good kermit program that will run
>on the Falcon? Any advice on these matters will be greatly
>appreciated. Thanks for your time :)

Only Kermit I've found, GEMKERMI.ARC, runs on Falcon, but I haven't tested
it yet. Use a Zmodem if you can instead. I also recommend Connect 2.46 for
a terminal - it should get FAX capabilities in next update (=rumour?).

Hi,

I'd like to know if the Replay 16 sampler and software work with the SM124 hires display and
if they work with STE-models?

Also, does anybody know of other 16-bit sampling options for ST-models?

If somebody has a cheap source for a Replay 16, I'd be interested.

Greetings, Jouni Alkio

Add the following line to your WARP9.DAT file (in your boot drive's root directory):

POP2.TOS s0

That will disable the Warp 9 screen saver when you run the game.

>as the original work has already been done on a ST.

I got two STE's, one ST (old one), and a Falcon. I sure would like to see
those supported as well as the Falcon, but we have to face the fact that
there will be no more ST(e) owners in the future. If there is suppose to
be an Atari market, then it'll be build on the Falcon, in the future. And
so it should be, cause the Falcon is a new machine with many new possibilities
which deserves to be tried out.

>The hopes for the Falcon should and are not carried by ASH, the Behnes
>but about Atari themselves.

Wrong!. Atari made their computers. Now it's up to others to build software.
Why should Atari care for the support if there isn't any software ?

>And if those people at atari have already got prototypes of a falcon040,
>running with some very interestin specs, as one atari techinician (former
>atari technician) at the Texas facility told me, and then they decide not
>releaseit, to close the Texas research center etc.. and concentrate on
>gemas consoles, what more do you want?

I don't think a 040 version is coming from Atari. (it's coming from C-lab)
Atari Co. has "hopefully" quit the computer market, to let others continue
what they didn't manage to finish.

>I cannot say more that there magic for Flcon is definitely worked on, if
>you believe it or not, the rest is up to Atari.

Atari got nothing to do with this at all. Atari is responsible for the
hardware, not the software.

>There is an extremely high demand for NVDIO on all machines, and there is

>release of NVDI 3 with integrated vector scalers etc. was to be givn
>priority in order not to lose customers to Compo.

Ehh. Wasn't NVDI suppose to be a screen accelrator. How come it's messing
around with Speedo font and things like that now ?
I'm sure the demand for NVDI was basicly for the screen accelrator and not
for some kind of font utility. At least those i know who now has the new
NVDI mostly use it together with text/dtp programs. And i really don't
believe thats where the common atari user is.

>NVDI never was supposed to be just a screen accelerator (this is just the

>Thus it is absolutely natural for a VDI replacement to use also Speedo
>technology, device handling or anything else in that matter that has been
>added to the VDI (or GDOS) in its course of development.

Maybe i'm wrong about NVDI and what it was meant to be. I've only used it
as an screen accelrator, cause i never had any special need for playing
around with font's ect.

>Well, some dreams come true. :-) I would not be surprised if 1 or 2 months

Agree, but there isn't going to be more ST owners. Thats what i'm talking
about.

HM> I doubt that. More people have NVDI than Mag!C.

Yep, but how many people want to pay the exstra cost, just to get the options
of using SpeedoGdos5 bla bla bla. font! ?

HM> It is not a tool for DTP handling. Sheesh.

Then tell me who has the need of using Font's ?
Mostly it's text and Dtp programs.

HM> Blame Compo (yuck) for their stupid legal action against Behne and others.

It really has nothing to do with Magic, (in my opinion). They just felt
it would be better to release a new NVDI before Magic because of Compo. But
don't forget they'd release Magic for the ST first. It really dosn't make
any sence to me.

HM> It'll be there. And you won't believe your eyes.
HM>

I hope you're right.

That depence on your DTE speed. If you had set your DTE to 115000 at both
machines, you can get more than 10.000 cps with a straight ascii files.
I've tested that on my Falcon.

> of money....

Roger, poor old Roger. You couldn`t see the future even if it hit you in the face, could you? What you refer to as "very very good phone lines" are already a reality in most of the civilized world! Why don`t you write a letter to your telco and ask them to switch to a modern phone-system (like Ericsson`s AXE-system :-) so that you can enjoy the fruits of progress in the modem-world.

AFAIK the V.34-standard is very close to the physical maximum of todays phone-systems. As I see it the next step will be full ISDN. With todays prices and technical development my guess is that it will take at least two more years before ISDN becomes really popular here in Sweden. However, until the whole phonesystem goes digital we will still need a good analog standard. V.34 is here and within just a couple of months most BBS:es and other providers will have it.

Saying that 28k8-modems are a waste of money might be true for you, but face it, for most of us it`s the opposite. If cheap ISDN for normal people was waiting just round the corner then it would of course be a waste of money to invest in a short-lived standard. But since ISDN still is quite far away V.34 is a good investment, IMHO!

Message-ID: <3dusva$r5a@msunews.cl.msu.edu>
Source record: 173941

I am selling my entire Atari system, and you can benefit! All software and hardware has been tested (most of it used daily) and works at the present time. I am selling only because I need to switch platforms; if I could, I'd keep my trusty Atari!

Megabytes of public domain utilities, applications, and games are on the hard drive. If you buy Data Diet and Squish II with the hard drive, you get them all! Included: WINX 2.2 and GEMRAM (MultiTOS windowing effects on all TOS versions; really improves the look and feel of GEM apps!), complete GNU C/C++ package, Storm 1.02, fully opperational demo of Starcall (excellent telecomm package from Germany), graphics programs/utilities, DTP utilities, GFA BASIC 2.0, 3.5 and Assembler, many programming utilities, ST Aladdin (for GEnie), anti-virus programs, file finders, disk-repair programs, archive utilities, games (GNU Moria, GNU Chess, Patience, Scrabble and more), megabytes of informational files, system enhancements, and much more!

All software comes with manuals and, in most cases, original boxes. Of course, some of it never came with a box in the first place...

All magazines have lots of reviews, articles, and disk-based mags have software, some of which is not listed.

I prefer to sell everything in the "System" list together, but I will consider other offers. Because of this, only offers on the complete "System" list will receive the 15% discount.

Add shipping to all prices. Orders of $100 or more receive a 10% discount.

Since I want to try to keep the system together (easier to package), anyone who wants to buy everything on the "System" list receives 15% off the list price, and I'll pay half shipping! If you want to buy more than what's on the "System" list (or substitute for equal or greater value), you'll still get 15% off and only half shipping.

Prices and terms are (somewhat) flexible, so make me an offer!

Questions? Ask away!

Please send all offers and inquiries to the following address:

t.hopper@genie.geis.com

Tom Hopper

6075. MiNT

Newsgroup: comp.sys.atari.st
Date: 1994-12-29 18:27:52 UTC
From: smoore@chowgar.demon.co.uk
Message-ID: <788725672snz@chowgar.demon.co.uk>
Source record: 173944

I have decided to attept to install MiNT and MiNTnet on my Falcon so I can access the WWW with Lynx. I know that there is a binary version of MiNT 1.12 but is there a binary version of MiNTnet?

Also, is there any software that will let me use gopher with MiNT?

Thanks.

Date: 1994-12-29 18:30:11 UTC
From: fvdakker@sterbbs.nl
Message-ID: <32371YBXCDNUQVSETQH@sterbbs.nl>
Source record: 173950

an>My father was recently given an Atari 520ST that someone
an>needed to get rid of. He seems to have it up and running and
an>is very happy with it, but would like to use it to get connected
an>to the internet.

He's not the only one :-)

an>I know virtually nothing about the machine but had him read me the
an>specs out of the original manuals over the phone (He lives in LA
an>and I live in ME). It seems like a cool little machine albeit
an>underpowered compared to today's machines.

That's Atari :-)

an>I'd like to help him set up some basic comm functionality with his
an>system. The manual states that the built in RS232 port can handle
an>buad rates up to 9600 bd. He also has a vt52 emulator built into
an>the GEM(?) gui os. Can he go out and purchase a hayes standard
an>9600 external PC modem and hook it up to the RS232 port?

Yes! only you should have a fix for the RTS/CTS fixing.
check for it at e.g. micros.hensa.ac.uk
For internet-access: there is a program called STNET avaliable from
ftp.demon.co.uk, but I have lots of trouble in setting it up.
When it's set-up it seems to be a pretty cool program!

an>I'm a fairly cabable Internet Navigator and have read all the
an>atari newsgroups, browsed atari web sites, done veronica searches,
an>and browsed ftp sites looking for stuff for the 520ST. I haven't
an>turned up *anything*.
an>Everything is aimed at MegaSTs or Falcons.

If that were true....
There still is a lot for STs. only sometimes you need some more RAM...
or and HardDisk...

an>I am interested in *any* information on the 520ST such as vendors,
an>software sites, hardware options, and the like. Also, I'd like
an>some info on the various Atari systems such as the MegaST and
an>Falcon; particularly on the processors, hard drives, floppies, and
an>other sub- systems of each.

check out the ftp-list.
Or for www: http://www.dl.ac.uk/MISC/ATARI/atari.html
From there all the links can be found.

6077. Re: SC1224 magnetized... help!

Newsgroup: comp.sys.atari.st
Date: 1994-12-29 18:41:25 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3duvsl$r5i@golem.wcc.govt.nz>
Source record: 173946

] I made a stupid mistake the other day and put a clock radio down on top of
] my sc1224 monitor (the original RGB one with the dials on the side).
] Anyway when I turned on my computer today the screen was all rainbow
] tie-dyed. I moved the clock away that second and most of the color
] distortion is gone, but I still have a purple blotch in the top left
] corner of my screen. Does anybody know an easy way to fix this? A year
] ago a friend put a car stereo speaker on my TV set and the magnet
] distorted the screen so badly that it is still all funky. Hopefully any
] solution will help with that, too. Thanks in advance.

Decent monitors have automatice de-gaussing circuitry, the SC1224 (at
least, my one), doesn't. The simplest thing to do is just leave it alone,
it will eventually fix itself unless it's been that way for a LONG time.

It also depends how powerful the magnet was, again, if it was relatively
weak, it shouldn't cause any obvious permanent damage. Just leave it
alone for a week or so & hope! (Leave it turned on all day will help)

] I saved it as a 16 bit mono AVR file...
]
]
] Is there some thing that I am doing wrong...

That's probably your problem, AFAIK Soundlab can't handle 16-bit samples.

Save it as an 8-bit, mono SND/SPL file. Then load it into Soundlab and
if it sounds scratchy, hit the high-bit button. It should work, it not,
the file is corrupted.

] >Also, are there any pd fax programs anyone could
] >recommend for me to try out my modem's fax capabilities?
]
] ComaFax is a german shareware FAX-program (with a messy interface though..)

It's also insanely expensive. For what they're charging I could get the real thing! (e.g. Phone with built-in fax & answer-phone). It'd sound a lot better too... (Voice modem on a 19.2K serial port is a waste of time, it sounds awful).

Is there a program, that is nice & simple, that will just translate an ASCII text file into fax-format, and send it to a number, or do we have to have all this pretty-looking interface and high cripple-ware fees?

I know it's a shock, but I find myself preferring the simplicity of the PC fax programs :)

Thats correct. V.34 uses frequencies of up to 3429 Hz. That is really, really
close to the physical limit.

>face it, for most of us it`s the opposite. If cheap ISDN for normal
>people was waiting just round the corner then it would of course be a
>waste of money to invest in a short-lived standard. But since ISDN still

In Germany the E(uropean)ISDN is picking up tremendously. 1995 will be very
exciting for this matter. The monthly fees arer still higher compared to
analogue lines. But the prices for the terminaladaptors and phonesystems are
picking up monthly.

The upcoming new ZyXel with V.34 _and_ (E)ISDN will be a very interseting
piece, if the price is competitive.

>Yep, but how many people want to pay the exstra cost, just to get the options
>of using SpeedoGdos5 bla bla bla. font! ?

Loads of people. Masses. You should've seen 2B selling the upgrades on the
recent shows. The disks nearly vaporated.

>HM> It is not a tool for DTP handling. Sheesh.
>Then tell me who has the need of using Font's ?
>Mostly it's text and Dtp programs.

Text-programmes make use of the vector-fonts. That's correct. But many apps
use them for screenfonts as well. Without the GDOS-part of it you wouldn't be
able to use _any_ other fonts *systemwide* on your machine.

Without GDOS and improved VDI you couldn't print high-quality grafics from any
programme. The developers would have to do invventing of drivers all over
again. GDOS introduced a broad variety of OS-calls to do just that.

NVDI is definetly not only a screen-accelerator. It is a complete replacement
for the buggy and slow Atari-VDI.

The most popular publishers on the Atari use entirely different fonts.

>HM> Blame Compo (yuck) for their stupid legal action against Behne and others.
>It really has nothing to do with Magic, (in my opinion). They just felt
>it would be better to release a new NVDI before Magic because of Compo. But

The legal stuff cost enormous amounts of time and efford. That hat to be taken
from somewhere, you know.

>don't forget they'd release Magic for the ST first. It really dosn't make
>any sence to me.

Huh?

Take a look at a new shareware QWK mail reader, Kivi QWK. I've uploaded it
to the following ftp-sites: ftp.funet.fi, ftp.uni-kl.de and ftp.cnam.fr.
If I get through, you'll find it also from atari.archive.umich.
Packet will be named kivi_qwk.lzh or kivi_116.lzh.

Features:
- Works with every Atari TOS-computer.
- Full, clean, easy to use multiwindow GEM-program.
- Supports Falcon/TOS 4: 3D buttons, upto 16 colours.
- Supports MultiTOS: drag & drop, autoclose, tos-programs in windows.
- Supports GDOS & SpeedoGDOS fonts.
- Dialogs in windows.
- Multiple signatures & taglines.
- plus many other features.

Feel free to drop me mail about this program!

> I have decided to attept to install MiNT and MiNTnet on my Falcon so I can
> access the WWW with Lynx. I know that there is a binary version of MiNT 1.12
> but is there a binary version of MiNTnet?
>

In the MiNT-NET archive (net-060.tgz), the binaries are included.

> Also, is there any software that will let me use gopher with MiNT?

There is a gopher port, but if you already have lynx, why not gopher
with it?

In the commandline you write: lynx gopher://gopher.st-elsewhere.edu/
if running gopher you write: gopher://gopher.st-elsewhere.edu/

Here is a reply to a 28.8 post in comp.dcom.modems, may be you will believe
that, but as they say Facts are Facts...!!!

Expecting 28,800 bps? Your results -will- vary.

If you find that you're unable to achieve full speed 28,800 bps
connections or your new 28.8k modem sometimes behaves erratically, the
reason is almost always a phone line impairment. Either insufficient
bandwidth, poor signal to noise ratio, or an imbalance in the phone
lines... either yours, the phone lines of the system you are calling, or
in the lines and telephone switching equipment _anywhere_ along the way.

Here are the minimums:

28,800 bps V.FC/V.34 requires 3200 Hz bandwidth, from 320 - 3520 Hz.
26,400 bps V.FC/V.34 requires 3000 Hz bandwidth, from 375 - 3375 Hz.
24,000 bps V.FC/V.34 requires 2800 Hz bandwidth, from 467 - 3267 Hz.

I should qualify the above by stating that V.34 can shift the whole
baseband down a bit further to compensate for a poor top end but I'm
sure everyone gets the idea.

By contrast... a 14.4k bps (V.32bis) link requires a usable bandwidth of
only 2400 Hz, from 600 - 3000 Hz.

Alas, while most U.S. domestic phone lines can easily support the
requirements of 14400/V.32 bis, many fall short of being able to
provide the technical operating parameters necessary for V.FC and
V.34 to function at _FULL_ speed. This, in a nutshell, is what you (and
several others) are experiencing.

Compared to V.32 & V.32 bis, 28,800 bps requires 33% more bandwidth,
26,400 bps requires 25% more bandwidth and 24,000 bps needs 17% more
bandwidth. This additional bandwidth _MUST_ be there from end to end,
all the way from one modem to the other. Either you have it or you
don't, and your modem is as much as telling you by its performance.

Here are a few suggestions you can try:

Go throughout the house and disconnect -ALL- telephonic devices attached
to the phone line. This includes extension phones, answering machines,
fax machines, caller-id boxes, line-in-use indicators, cordless phone
base units, demon dialers, remotely-read utility meters and voltage
spike protectors or line filters like those commonly found in PC Desktop
master-switch power directors and power line conditioning units. If you
find that any of this helps, then start plugging things back in one by
one until the culprit is identified. It could even be a combination of
things. At the office you may find that your 28.8k modem will perform
better when provisioned with an outside line, one which does _not_ go
through the pbx or a multi-line key system.

If your phone service arrives via a subscriber loop concentrator or
remote terminal or other "pair gain" device such as the ubiquituous
SLC-96 then all bets are off and you'll probably have to settle for
24,000 and below on most calls with 26,400 being a rare treat, indeed.
I've never heard of anyone regularly achieving 28,800 through a "slick".

Of course it should go without saying that your mileage will vary.
Opinions are my own. I represent no one other than myself in this forum.

That's the point: All this whining about some really harmless posts
of *small* binaries already takes a multifold of the volume of these
incriminated posts! This is insane. So better stop this whining and
be a bit more tolerant. It doesn't pay to act furiously.

Roger Sheppard. (sheppard_r@ix.wcc.govt.nz) wrote:

: The first few bytes of the file are .snd !!!
: is this not a AU file...

Curiouser and curiouser: TYypically, .SND files are regarded as 8-bit mono unsigned raw samples.

: 525 list it as a mono 16 bit u-LAW signed SND file....

Hmm. Strange. u-LAW is normally the domain of Sun .AU files. (I don't know of any other sample format that uses U-Law)

: I saved it as a 16 bit mono AVR file...

Well now there's your problem: Soundlab can't play 16-bit samples. That's why you're getting distortion. 16-bit samples need a different routine to play than 8-bit samples do because in 16-bit samples, each individual sample occypies two bytes of data rather than one byte that 8-bit samples do. SoundLab only plays 8-bit samples, and so when it tries to play a 16-bit sample, it plays it one-byte at a time, rather than two-bytes at a time as it should. Damien has proimised a new version of SoundLab in the future that will support 16-bit samples.

: Is there some thing that I am doing wrong...

Convert it to 8-bit unsigned SPL or WAV or some other similar format and you should have no problems. Oh, mono, too.

OK - I think it's time to give this a rest.

I started this thread (unfortunately) - I only wanted to know if a 28.8K
modem would run on a Falcon and about mods to an ST(e) that were necessary
in order to use one.

I have found out this information and so no more arguing please???

And yes that includes _YOU_ Roger S. Face it - we live in a dump of a
country, tech-wise (well and a _lot_ of people-wise too...)

Oh, and that last statement is _not_ open to discussion.

I like talking about Ataris in this group, how to program them, what's available
etc. And je m'en merde about all of these arguments - and I think _most_
ppl just want to get on with things and not piss about reading all this rubbish.

On a different note:

Have a good New Year all, and thanks for the help I have received during
the year. It was really appreciated.

Richard =8-]

That's what I've heard. One will be commercial, and won't support MiNTnet, and
the other will be free/shareware and will be a sort of HTML shell, with
external programs doing the connections - and so MiNTnet support is likely.

Please correct me if I'm wrong :-)

I just state some facts, but if you don't like them that is your problem,
Facts are Facts no matter who posts them...

I have been involved with Modems for some 20 years, 11 years with DataBank as a network Eng,, I also installed the very first Datel 2400 link to the USA...

Also here are some more Facts, but if you are that juvenile to understand them then again that is your problem...

Jeff McDermaid <captnmac@kaiwan.com> writes:

The file net-060.tgz *has* compiled versions in it, it just looks like it doesn't. The main files are .xfs and .xdd MiNT additions. All the utilites have *no* extensions (like .ttp or .tos) as they are all suposed to be run from a shell.

MiNT-Net is not easy to set up - but is well worth it once yuo get it going IMO.

:-)

I know *exactly* what you mean! OTOH I don't think there is going to be
a good software cure - at least not one which works with games which mess
about with the keyboard controller.

There is a program around (one version sold with Mouse Tricks 2) which lets
you use a PC serial mouse in serial port. Might work for you - or OTOH if
you can figure out how to do it - then maybe you could patch it for the
joystick port.

Now I come to think about it though the joystick port doesn't have all
the signals the mouse port has - so its probably a non starter anyway.

:-(

Roland.

net-060.tgz (or somthing close) on many archive sites in ~mint/Network

This has the binaries in there - though you have to look had for them.

> Also, is there any software that will let me use gopher with MiNT?

I'm sure I saw a gopher.tgz in ther as well.

Alright - I want US prices and distribution sites for either Medusa or
GE brand ATARI TT Clone machines. I'm looking for about 4-12MB and
120-540MB disk space.

Anyone got a used (and CHEAP) ATARI TT instead ?

Please email me with US prices.
Thanks,
Evan Langlois

ATARI 1040 ST COMPUTER SYSTEM $150 + Shipping

1 Meg. of RAM
Internal 3.5" disk drive
MIDI Interface (see Electronic Musician Magazine for possibilities!)
Mouse
Joystick
Amber monitor
Lots of software with original manuals (ie: word processor, database,
graphics software, many games, etc.)

Excellent condition!

Also included:
**** Computer Eyes(tm) COLOR video digitizer! ****

It has high quality graphics, a midi interface, GEM windows interface,
and software that makes it beneficial to anyone looking for a computer!
Plus it's easy to use!

Please contact mike (mikest@comtch.iea.com) with inquiries.

: >for a WP as their standard.

: >Steve

: Steve: do journalists count as professionals??

Not the ones that write for the Mirror, Sun, Sport and People.

I was implying that many organisations, such as Universities, probably would not
find this kind of word processing platform as stable or powerful as,
say, Word on Mac/PC.

With a more common platform such as Word or WPerfect, data is just som
much more compatible between institutions.

For example, my Uni uses Word/PC - As a scientist, I publish data in
Journals. A requisite of many Journals is a written copy AND and copy on
floppy, of the article. I just don't think they'd accept Papyrus docs.
(in fact I know they don't!).

BUT - If the Papyrus system works for you then use it.

Steven

IJ> > i have a 520STfm and want more memory.
IJ>
IJ> All depends how comfortable you are with soldering.
IJ> The 520ST has two banks for RAM but only bank 1 has chips in it. The chips

This is true in the STf and fm models only; the original 520 did not
have the second bank.

IJ> should be 256K each, and there should be 16 of them (each bank takes 16
IJ> chips). Now if you wanted to go to 1 meg theoretically all you'd need to
IJ> do is fill up the second bank in the 520ST. Whether this really works I
IJ> have still to find out.

It works; you'll also need three resistors to fill the missing spaces on
the motherboard (330 ohm, I think).

IJ> A neat little product that I found out about only recently is the
Marpet
IJ> Xtra-RAM board. It will allow you to put SIMM RAM into your ST instead of
IJ> the old DRAM. SIMM RAM is great because when you want to upgrade to more
IJ> RAM you just plug it in. The Marpet will let you go as high as 4 megs.

There's also the JRI SIMM board, which allows the usual 4 megs in SIMMs,
AND adds a second shifter socket, so you can get the STe palette on the
older ST.

> yes I have been in comms for some 11 years, and I do know some thing about
> modems, in fact I installed the very first 2400 modem link from here
> to the USA, yes it was 2400...

Do you honestly think installing a 2400-modem long long ago in a country where the phonesystem obviously is out-dated by a couple of decades makes you a comms-expert?

If you were a comms-expert you would have known that your phone-system was outdated. Saying that 28k8-modems are a waste of money just because YOU can`t use them is rather stupid, don`t you agree?

> As they say FACTS are FACTS looks like you need some...!!!

You have TOTALLY missed the point here! The facts you supplied are probably correct, but what do they tell us? They tell me that you are living in a country with an outdated phonesystem!

Get a grip!

>technically inclined, so please answer in layman's term, where
>possible. Also, anyone know of a good kermit program that will run
>on the Falcon? Any advice on these matters will be greatly
>appreciated. Thanks for your time :)

In your order....

Run it as fast as you can - 19200 is OK, but to get the best out of it
with plain transfers go higher. I use 57k+ and a 32k buffer with Connect
and it gets good transfer speeds.

No - don't reallt need a hardware fix programme - at least I don't use
one and all goes well.

Fax software? - Try Comma fax - nice German Shareware programme. The
shareware version is a little crippled until you register it.

Kermit? - I'll leave this to some one else.

Now a couple of questions for you - what comms programme are you using? On
a Falcon I highly reccomend using Connect - lots of features and using the
ANSI fonts and a VGA monitor you get a nice 33 line by 80+ collumn display
in all of ANSI's glorious colours. Now that statement is sure to get you
some comment on other's favourite comms programme!!

Regards,
Geoff

Kim Andersen (kim@dksoft.ping.dk) wrote:

: I got two STE's, one ST (old one), and a Falcon. I sure would like to see
: those supported as well as the Falcon, but we have to face the fact that
: there will be no more ST(e) owners in the future. If there is suppose to
: be an Atari market, then it'll be build on the Falcon, in the future. And
: so it should be,
: cause the Falcon is a new machine with many new possibilities
: which deserves to be tried out.

IMO, all machines should be supported, otherwise we will end up somewhere
in PC land where we always need to upgrade to another computer to still
use the machines. And once and for all: a magic version is being worked
on, you even got the official staement on that by Andreas Kromke who is
in the Magic team.

: >The hopes for the Falcon should and are not carried by ASH, the Behnes
: >but about Atari themselves.
: Wrong!. Atari made their computers. Now it's up to others to build software.
: Why should Atari care for the support if there isn't any software ?

Well, I don't think you can see that as simple. Atari is responsible
a) for producing the hardware
b) for marketing and selling the hardware
c) for maintaining the operating system
They failed in ALL three points. To see a future in the falcon computer
lineb and to get the Ste owners to upgrade to falcons we have to see not
only software support for it, but also support from Atari. I will not buy
a falcon030 with 16bit bus, 16 MHz 030 processor, slow video. I would buy
it only for MIDI and HD recording purposes.
My Mega STE has a detchaed keyboard. When I buy a falcon, I akready have
to mess around with Tower upgrades. For those, who have a TT, a falcon is
many ways a downgrade: No Fastram support, no big screen monitor support,
no maths coprocessotr as standard, no speperate casings.
See the facts: The falcon030 was meant as the low-level entry machine for
a completely new computerline, acompetition to Amigas 1200 etc....
But- with no professional versions available- and no new models in sight
it is as dead as the ST (with the exceptition of the HDrecording market).
You yourself see the fate of the falcon machines in third party
developments (C-Lab....) - so Atari failed in all things

: >And if those people at atari have already got prototypes of a falcon040,
: >running with some very interestin specs, as one atari techinician (former

: >atari technician) at the Texas facility told me, and then they decide not
: >releaseit, to close the Texas research center etc.. and concentrate on
: >gemas consoles, what more do you want?
: I don't think a 040 version is coming from Atari. (it's coming from C-lab)
: Atari Co. has "hopefully" quit the computer market, to let others continue
: what they didn't manage to finish.

Atari has a falcon040 machine ready. It uses a 68040 processor with 32/64 Mhz, has Extremely improved graphics (probably based on Jaguar like chip) "that outblows all PC cards except multi thousand dollar ones", 8 new custom chips (some of which are running at speeds up to 110 MHz), and a decent sound system, superior to the one in the Falcon030. The F040 was developed in Texas
The Falcon030, the"sparrow", developed in Israel, started out as a graohics card project for the Ste (with 16 MHz 68000 processor). The Texas crew suggested a 68030 instead of a 68000 and a DSP chip, a subset of the falcon040 sound system--> " a blown up Ste"
The F040 was ready by beginning of 93. that'how it was, according to a former Atari techinician from Texas, whose name I will not mention (who knows what difficulties he might get...)

C-Lab has licensed Falcon030 technology only. There has not been an announcement for a Falcon040 on the side of C-Lab. The licensing agreement allows for improvements necessary in the Audio market and for continuation of production, if Atari decides to stop the Falcon. The nmachines, that c-lab announced were a f030 look alike (C/lab Falcon Mk2), and a falcon pro in a 19" case. That's all. No F040.
C/lab is much smaller than Atari (runours say the company has just two employees....) - that's for the marketing part.

Now, where do you see a future of the falcon, if Atari doesn't do anything?

: >I cannot say more that there magic for Flcon is definitely worked on, if
: >you believe it or not, the rest is up to Atari.
: Atari got nothing to do with this at all. Atari is responsible for the
: hardware, not the software.

Not true. They were supposed to do the operating system, too. 12 people were working on it (TOS, MultiTOS) and the results we all agree upon ;-)
That is were Magic comes into effect, to compensate for Ataris failures on that side (you could still stick with Single TOS, if you want :-))

: Ehh. Wasn't NVDI suppose to be a screen accelrator. How come it's messing
: around with Speedo font and things like that now ?
: I'm sure the demand for NVDI was basicly for the screen accelrator and not
: for some kind of font utility. At least those i know who now has the new
: NVDI mostly use it together with text/dtp programs. And i really don't
: believe thats where the common atari user is.
: Maybe i'm wrong about NVDI and what it was meant to be. I've only used it
: as an screen accelrator, cause i never had any special need for playing
: around with font's ect.

a) you are wrong
b) here we are talking about software support, as you are saying.
Imagine, you would install a score font in NVDI and Calamus and Notator
would support it properly. You could interchange data and fonts with
Calamus and Notator easily. Notator could use scalable fonts for
labelling etc....: the fonts could be used in any other programs, too.
You would need only one printer driver, the one from NVDI - for all your
applications - Postscript output? with the respective driver no problem.
The fact that you do not take advantage of NVDIs features is, that the
software does not support it. So the only thing you use is just the
accelerating effect. Call C-lab, DMC or whoever to support operating
system features properly. The benefits would be great
(As for magic 3: long file names? clipboard? Drag and Drop? Pipes?)

: >Well, some dreams come true. :-) I would not be surprised if 1 or 2 months
: >from now we will see a new Magic owner in denmark :-)\
: I hope you're right, and i'm wrong.

Let's make a bet (Andreas Kromke, du haftest.... :-))

: >For free? I think you should give so. moeny to use it. IMO, format the
: >disks, and send a letter of congratlations to the former TOS crew at
: >Taligent for the extra empty disks for data storge they were able to
: >include with a Falcon.
: >

: Ah, thats a posibility as well. Not a bad idea 8-)

If you do it, I will add my disks as well. If all Atyari users wiuld do
that, we may even get the first release version of Taligent OS on all the
disks we sent in :-)

Regards,

Alfred

RS> Fast....!!!
RS>
RS>
RS> How about it chaps.... ??

Hi, are we talking about the utils cjpeg and djpeg ??
I ported these myself and they are quite easy to get compiled and running
So if you can get me the latest C source I'll port it.
I have ported POV raytracer too, and my TT can render images as fast,
usually quicker than a 486 DX2 50 that I use at work.
Who says the TT is slow ?

Cheers

: much more compatible between institutions.

True and not true. There are file formats available, such as the RTF
format, that allow for what you are looking for and are supportyed by
Word, Word Perfect and Atari wordprocessors.

: For example, my Uni uses Word/PC - As a scientist, I publish data in
: Journals. A requisite of many Journals is a written copy AND and copy on
: floppy, of the article. I just don't think they'd accept Papyrus docs.
: (in fact I know they don't!).

Well, they accept RTF docs. IMO, most scientific newspapers would like to
see TEX docs - so you can forget Word, Wordperfect and the lieks as well.
IMO, it would even put a bad light to use MS word for professional
scientific publivations. At least the output, for example of the Formula
editor, would cause people to vomit all over the world (but with "Formula"
on the Atari that is, of course, different)

: BUT - If the Papyrus system works for you then use it.
More than happilz (well, in my case not papyrus, but Tempus Word..)

Regards,

Alfred

>(in fact I know they don't!).

Papyrus can export RTF files which should be accepted. The only thing missing AFAIK is pictures since there is no common picture file format for the platforms using RTF. TIFF would be a fine soulution, though...

>BUT - If the Papyrus system works for you then use it.

Pap is simply *the* best WP for this platform. With the excellent support and developement from R.O.M. I can easily reccommend it to anyone. Also, if you're in Britain, HiSoft offers student discount on the package, making it an even better buy.

>
>
>
>What a load of RUBISH, that is only for TEXT data, 38.4k would be fast enough
>for Archive files, ie ZIP/LZH...

As i'd say, right ? The DTE speed higher than 38400 surely makes an
improvement wether or not you like it. Ofcouse you'll only see this
improvement transfering ascii files, but it doesn't hurt at all speeding
the DTE up to at least 57600.
Many people out there uses their modems on BBS's. With a higher DTE rate
all menu's, screen ect. will go alot faster as they're all plain ascii
caracters, right ? So whatever speed your hardware can handle will give
you benefits, and thats why you should use the highest possible speed.

>
>
>Unless you have very very good phone lines 28.8 modems are just a wast
> of money....
>

That really depence on your phoneline quality. You may have a problem
with highspeed modems, but thats because your phonecompany got a real
problem keeping their system up to date. Nowadays most of us are connected
to full digital centrals, (though we're still using analoge modems), and
trust me, a 28k8 modem is running just fine on such a central.

Next step is ISDN which is full digital communication. But untill ISDN
is becoming more normal, i'll say a 28k8 is worth the money no matter
where you are.

John,

If the magnetically induced distortion is fairly mild, it will gradually go away. Turn the monitor off and carry it around, orienting it in different directions. (Don't laugh. There's a reason for this.) Turn it back on and it will gradually clear up in most cases.

I get calls on this every few months. (I write about computers, audio and video.) A LOT of folks don't realize they need shielded speakers if they stick them next to their TV or video monitor, for example.

John,

DC Desktop is a very old program. DC is no longer in business. There are some good alternative desktops that you should consider. If money is an issue, try TeraDesk, which is freeware. As a NeoDesk 4 beta tester, I of course recommend that, too, but Gemini and At Ease are very good, too.

AFAIK the only versions of MiNTnet available are in source and binary form.
It would be nice if someone made binary only versions available as I'm sure
the source code confuses people or puts them off donwloading a new version
because of the extra space it takes.

> Also, is there any software that will let me use gopher with MiNT?
Yes, try a.a. on Mint/Network/gopher-xxx.tgz Are there any benefits to using
gopher instead of a WWW browser?

Hi,

I wonder if anyone can tell me the following :-

As far as I know the Falcon is ment to have eight 16bit sound channels, can all these be driven separately and can their outputs be tapped of separately. I.e. can you play eight different sounds simultaneously tapping them off at separate ports?

Also has it got an unrestricted expansion bus (not like the ST with no write line and 'Address error' problems)? With all the address and data lines available.

What type of hard disk and memory chips does it use ?
How flexiable is the 'Apple Talk' from a programming point of view?

I've been unable to find any technical specs. and manuals for this machine, could anyone tell me of any good books (E.g. Atari ST Internals was okay) for the machine, or an FTP site where I can get some information.

Many thanks.

Apex supports the Screen-Eye card from Matrix and the Expose card from Titan
Designs. It has recently been suggested that support for Vidi-12 (I think it
is) be included. The coders hae said if some one can provide interface data
then support would not be that difficult to achieve.

HM>

And what is loads of people then ?
I know NVDI can replace the system font if thats what you want, but what
we're talking about here is the need for the new NVDI or for Magic (for the
Falcon).
The old NVDI could also replace the system font, so what was so important for
releasing a new NVDI before releasing something as good as a total new
replacement of the OS, (cause thats hopefully what Magic is).
Every atari owner can be (or should be) interested in a new OS, (wether or
not it's able to do multitasking), but not every atari user are interested
in a new NVDI, which just support other fonts (or whatever the new NVDI
does).
Thats is what i'm talking about, and it really makes no differences if the
new NVDI is an replacement of the VDI or not. The old NVDI is an replacement
of the VDI as well.
So now you tell me what was so important to release the new NVDI before
anything else ?

Which i can understand. But as far as i can read between the lines in the
messages about MacMagic, they have reach alot futher with that.

HM> Companies have to make a living, you know.

Ofcouse. and i really give them this as well. My point is rather that they
make their livings on a place which isn't going to improve the market.
The future atari market will be based on Falcon's (and clones), so why not
support this insted of spending time on other things.

HM> With all your senseless complaints about MagiC you really start pissing me
HM> off.

Yes, ofcouse i'm the one beeing wrong for caring about the atari market,
seeing our market beeing totally destroyed because of lack support on
software. Ofcouse i'm the one who is wrong when seeing friends change to
other platforms because they can't get the software or don't find any
improvements on their side. I could ofcouse follow them, which i have to
admit i'm very close to.

HM>
HM> If I were a dealer, I wouldn't give a damn about a tiny little market over
HM> there in the firstplace.

No ofcouse not. Why should you care at all. You're probably doing fine
where you are, so why care about the rest.

Sure i understand, but no, i don't understand it.

I've been told Magic is a totally new OS, (improved), so all atari users
should be interested in this. But you say NVDI will sell 10 times more.

I may be stupid, but where is the benefit in buying software for a slow OS
if you could get a better OS and from this probably also better software ?

I honstely don't understand you guy's. I'm very sorry as i may have
misunderstood a few things, but the above makes no sence to me at all.

6148. Re: Falcon 040

Newsgroup: comp.sys.atari.st
Date: 1994-12-30 21:22:16 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9412302024.AA01389@ilmen.lanl.gov>
Source record: 173818

I forget who I was discussing this with, so kindly forgive this somewhat off-topic public post in lieu of email.

I recently stated that a PowerPC-based Falcon would make more sense, IMHO, than a 68060-based unit because the PPC could emulate 680x0 software with very little, if any, performance decrease until PPC native software arrived. (This is all theoretical, BTW... I'm not predicting Atari will do this).

I also stated that my Apple PowerMac 7100/66 seemed to be every bit as fast in emulation mode as my 32MHz Apple Quadra 660av, although that was by my rather unscientific 'seat-of-the-pants' method. OK, I've finally run a benchmark using the latest version of Speedometer (a Mac benchmark utility) on both machines and the PR (Performance Rating) is as follows:

	PowerMac 7100/66 (68K emulation)	Quadra 660av (040 at 32MHz)*	Quadra 650 (040 at 33MHz)	PowerMac 7100/66 (native PPC mode)
PR	1.20	1.53	1.56	3.97

*The 660av tested has a 25MHz 040 clock-doubled to 32MHz.

So the bottom line is that while the PPC -is- somewhat slower, it's nowhere near the 2 - 2.5x slower than a Quadra 650 (as the MacWorld article supposedly stated). Of course, your mileage may differ. :)

And just to keep things in perspective, realize that a 'lowly' 25MHz 040 (which is equivalent to a Speedometer PR rating of 1.0) is about 5 times faster than a 16MHz 030 installed in our Falcons. Now imagine a PPC that runs 4-6 times faster than that! Wowza! :)

Sorry for the Macintosh-trivia but it was due to the Falcon 040 debate.

Cheers,

-Hutch- @ Fair Dinkum Tech

>in the Magic team.

Why should all machines be supported. By saying this you stop all developments.
Will you also support old 520ST machines with only 360K floppy drives
512Kb memory, and even better, it may be running Tos 1.0 og floppy.
How on earth will you support such an machine now, and even make a few $
from it ?

>Well, I don't think you can see that as simple. Atari is responsible
>a) for producing the hardware

And so they did.

>b) for marketing and selling the hardware

They did, but not good enough.

>c) for maintaining the operating system

They did this as well. They didn't do a good job, but at least they manage
to make some improvements.
And talking about OS's all developers are free to build a new OS.

>They failed in ALL three points. To see a future in the falcon computer
>lineb and to get the Ste owners to upgrade to falcons we have to see not
>only software support for it, but also support from Atari. I will not buy
>a falcon030 with 16bit bus, 16 MHz 030 processor, slow video. I would buy
>it only for MIDI and HD recording purposes.

I'm sorry, but i don't agree with this. Count on your fingers and tell me
how many people who is still out there using the old 520ST floppybased OS
and with only 512Kb memory. There isn't many left, which means either they
have changed platform, or they have made some upgrade in some way. Many of
those did make an upgrade to a better machine. So what so be so wrong in
changing from a MSTE to a Falcon, (or maybe even a clone).
Thats only normal. Just like the Pc's. How many is left with old 286 (or
even worse) machines ? Most of them upgraded to be able to run new software.

>My Mega STE has a detchaed keyboard. When I buy a falcon, I akready have

>it is as dead as the ST (with the exceptition of the HDrecording market).
>You yourself see the fate of the falcon machines in third party
>developments (C-Lab....) - so Atari failed in all things

Atari should never have been made reponsible for creation of software for
their hardware. Look at the way the PC is beeing distributed for god sake.
None of the PC produceres are making software, beside IBM.
And why should they, they know they just have to make hardware, and then
others will build software to _support_ it.

>Atari has a falcon040 machine ready. It uses a 68040 processor with 32/64

>The F040 was ready by beginning of 93. that'how it was, according to a
>former Atari techinician from Texas, whose name I will not mention (who
>knows what difficulties he might get...)

Which may be true, but the point is not who is making what. The point is
who can make something which is beeing supported with software.

>
>C-Lab has licensed Falcon030 technology only. There has not been an
>announcement for a Falcon040 on the side of C-Lab. The licensing

>nmachines, that c-lab announced were a f030 look alike (C/lab Falcon
>Mk2), and a falcon pro in a 19" case. That's all. No F040.
>C/lab is much smaller than Atari (runours say the company has just two
>employees....) - that's for the marketing part.

Thats not what i've heard. As far as i've been informed C-lab is doing
a Falcon mk2 68030 with a possibility of upgrading to a 68040 (when it's
finished). But since i havn't heard this myself directly from C-lab, i can't
say for sure, and neither should anyone else, unless they've been in contact
with C-lab.
But we still got the Atari Falcon 030, which is missing alot software to be
supported.

>
>Now, where do you see a future of the falcon, if Atari doesn't do anything?

Many places, as written above.

>Not true. They were supposed to do the operating system, too. 12 people
>were working on it (TOS, MultiTOS) and the results we all agree upon ;-)

I'm not saying they did a good job, but they did a job. If other feel they
can do better, i hope they'll come forward and do their job. Everybody is
free to write a new OS for the Atari machines.

>That is were Magic comes into effect, to compensate for Ataris failures
>on that side (you could still stick with Single TOS, if you want :-))

And i have been waiting many years on this.

>: >Well, some dreams come true. :-) I would not be surprised if 1 or 2 months

How much ? .-)

>: Ah, thats a posibility as well. Not a bad idea 8-)
>
>If you do it, I will add my disks as well. If all Atyari users wiuld do
>that, we may even get the first release version of Taligent OS on all the
>disks we sent in :-)
>

Is it really woth it ? When you say Magic is beeing released, why not send
our disk's to the Magic team insted. They could probably use some free
disk's unless it's going the way Ofir just said to me in previous message.
8-)

In <3dvjbv$2hm@golem.wcc.govt.nz> Roger Sheppard. wrote:

>What a load of Crap, you are not a modem expert, I have been for 11 years...
>

And it seems like you'd left your expertice 11 years back as well Roger.
I'm really trying to behave here, so excuse me if i might mention a few
harsh words.
When many people tells you, after they have bought or tested a 28k8 modem,
that it's working, and even working fine without the problems you're
mentioning, and still you continue beeing stupid, you show your expertice
at a very low level and it's really not worth anything you say.
I've had the plessure to test a 28k8 modem here, and the tests where almost
fine, (had some problems with 115000 DTE when transfering ascii files which
is caused be the computer i was using. I reached about 9000cps when i started
to get crc errors when writing to the harddrive). This is not caused by the
modem or the phoneline, it was caused by the computer(software, (which btw.
was a Falcon).
After i had the problems i tested it again on a Pentium, and i reached 11480
cps in advage, without any errors.
So after this i don't really need you telling me it isn't going to work.
It did work here on my phoneline, believe it or not!!!

I'm sure you can find some 28k8 modems which _IS_ giving problems of somekind
but thats only normal, just like we can find ALOT of 14k4 modem which is
giving problems as well. Also you may find alot of places where the phoneline
quality can't handle the high speed, and this is caused by old phonecentrals
which is all beeing changed from time to time, especially for beeing able
to handle the high amount of data which is going to be send in the future.
As i wrote to you in my previous message, many countries are working on
full digital phonelines, and the reason is, they have an obligation from their
costumors who is demanding the high quality to be able to communicate in
the future, wether or not it's beeing full digital (ISDN) or analoge like
now.

And like you said yourself, fact is fact!

You're absolutely correct.

I worked for a company once which sold high-end graphics and animation
systems. Those monitors were specificly adjusted on location, to compensate
for the magnetic distortion!!!

Turn a TV-set with the screen facing upwards and watch the picture quality get
worse and worse ...

Atari Falcon030 + Atari ST/Falcon Software For Sale:

Atari Falcon030/4/85 w/ Tons of Software ..... $850 obo
Includes ICD utils, UIS 3, Speedo G-Dos, MultiTOS,
AtariWorks, Ishtar II, PageStream 2.1, Edhak 3.0, CardFile 4, and Much more installed.
Ready to use with a VGA monitor.
CD-Rom/Floptical/SCSI Drive Ready. 1.44 MB Drive.
Perfect Condition, no problems so far.

Software:
(All original Disks w/ Manuals)

Games:
Ishtar 2 (Falcon only) $20
AmberStar (RPG) $15
Civilization $15
Dungeon Master $10
The Games (Winter) ..... $ 5
Ultima III ..... $ 5
Zak McKracken $10
Pang ..... $ 5
TNT (Xybots, Toobin', APB, Dragon Spirit,
Hard Drivin') $15
De Ja Vu ..... $ 5

Applications:
Personal Pascal $15
GFA Basic 3.5 ..... $15
CardFile 4 ..... $15
EdHak 3.0 ..... $ 5
Safari PD Type 1 fonts I & II (15 Disks) $15
Print Master + ... $10
Utitlities:
ICD Utilities $10
Universal Item Selector 3.32 ..... $10

I also have a SSDD Drive Mech and the old MagicSac
Cartrige and disks (MAC emulator with 128k roms). The MagicSac
Can be used as a cartrage clock if you can soder on the battery connectors.
..... $ 5 each

Buyer pays shipping, ect. PLEASE Make me an offer.

Howard W. Sams is a technical publishing company that puts out publications called ComputerFacts. These are service manuals (with schematics) for older computers. Among the ones they sell is a CF for the 520ST and monitor. I _don't_ have the phone or address handy, but they maintain an 800 phone, so they shouldn't be too hard to find. ;)

[some text deleted]

: For example, my Uni uses Word/PC - As a scientist, I publish data in
: Journals. A requisite of many Journals is a written copy AND and copy on
: floppy, of the article. I just don't think they'd accept Papyrus docs.
: (in fact I know they don't!).

: BUT - If the Papyrus system works for you then use it.

: Steven

Papyrus does export Rich Text Format files, a Microsoft standard that
their product "Word" should be able to load just fine. Maybe you too
could make use of Papyrus on projects for your University.

6159. Michtron BBS s/w: Works w/9600?

Newsgroup: comp.sys.atari.st
Date: 1994-12-31 08:31:00 UTC
From: bryanw@best.com
Message-ID: <bryanw.788862655@shell1.best.com>
Source record: 173840

Hello,

does anyone know if michtron's bbs software has been modified by
anyone to work with 9600bps modems?

a local bbs would like to get 9600 baud working and still keep
using michtron.

if you have hints, please email me.

thanks,
b

I need any and all information on the Mac/Atari thing! An e-mail address,
Company or author name,etc.
If anyone is using this,I need to know how it works with midi suff.
All help will be geatly appreciated,and all messages will be answered.
Thank You
Drew

>Which i can understand. But as far as i can read between the lines in the
>messages about MacMagic, they have reach alot futher with that.

A MAC doesn't have the advanced DSP stuff a Falcon comes with. The HW is much
closer to a TT than to the bird.

>Ofcouse. and i really give them this as well. My point is rather that they
>make their livings on a place which isn't going to improve the market.
>The future atari market will be based on Falcon's (and clones), so why not

I doubt the market is based on a Falcon. For music stuff, ok. But a Falcon is
way slower than a TT. Nobody in publishing would bother with a Falcon. Theyï¿½d
go for a Medusa, Eagle or MagiCMac.

>No ofcouse not. Why should you care at all. You're probably doing fine
>where you are, so why care about the rest.

Trying to be sarcastic? I think you have no idea about running a company and
making a living from it.

>You just said it yourself. Atari did make the Falcon, which in my opinion
>is a proper hardware.

Falcon proper HW? You got 2 B kidding. It was absolutely outdated the moment
it hit the streets. (Except the DSP-part).

>HM> Sheesh, where elso should they be if not in this market.
>Me, i'm doing in the general use. I most do BBS and music. Many atarians are
>all gamers, which got nothing to do with fon't and or NVDI.

Great, you're talking about games. If I wanted to play games, I'd buy a cheap
PC. The market in Germany is the most professional and therefore the most
important Atari-market in the world. The local demand for vector-fonts is very
high. It gives you an excellent output in print or graphics.

But you don't need it if you're a gamesperson.

>I run a large BBS in scandinavia, and from what i've seen it's not stuff like
>texteditors and DTP/Fon'ts which is doing best on the top.

It is here.

>I also have SpeedoGdos, but why should i slow my system down, just for
>seeing some different font's.

NVDI wouldn't slow down your system at all. Quite the opposite.

>
>What a load of Crap, you are not a modem expert, I have been for 11 years...

So, you are? What is the current redial limitation of modems with German
BZT allowance? What was the limitation before? You, as an expert, should
know that, right? And the DTE speed should be set to 4 times the physical
modem speed, if possible, 2 times is acceptable, still, but less is
terrible unless you only transfer GZIPed or LHARCed data.

>>You're a waist of bandwidth in the first place.
>
>No you are for the Rubish that you post here.....

Hey, stop this. if anyone here posted rubbish, it is you, Mr. Sheppard, by
reposting the article of comp.dcom.modems TWICE and by claiming that this
article contradicts the possibility of 28,800 connects. c't (the German
BYTE, some say) have just tested 28,800 modems and had no problems with
several ones. Mostly firmware problems with the others, I think. I can
check the exact results for simulated local, national and overseas lines,
if you like, but 28k8 is in no way impossible.

Ah, btw, citing other people's signatures is a waste of bandwidth, unless
you really want to refer to the sig's contents.

Hello,
I am currently upgrading my TT030 memory to 16 megs with a third party ram board and I subsequently have a spare TT 4 meg ram board for sale. I know some people purchased TT's without the TT ram boards and to let these people know that this machine is totally different with a TT ram board. It feels much faster!!!!! I am open to offers and of course would prefer to sell in Australia but I am open too any offers.
Regards from OZ
Mark

>Do you understand $$$? NVDI sells 10 times more than MagiC.
Although I understand what you're saying, Ofir, and agree with you, your statistic doesn't prove much; the other nine out of ten could be Falcon owners :-)

A bit more seriously: The Falcon IS a large part of the Atari market; although there are many more STs out there, most of them are gathering dust.

6166. New TOS bug ?

Newsgroup: comp.sys.atari.st
Date: 1994-12-31 14:23:06 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <12311994.142306@empyr.dircon.co.uk>
Source record: 173844

Hi,

I suspect I may have discovered a new bug in TOS version 1.4

I recently upgraded my friend's 1040ST from TOS 1.0 to TOS 1.4 and now it refuses to talk to his Akai X7000 sampling keyboard correctly.

More specifically, all three programs we tried, Universal Sound Designer, Turbosynth and SF Librarian / Sample Editor reported midi communications errors. The SF Sample Editor was more specific, reporting midi checksum errors. These errors only occur when trying to transfer sample data via midi.

Suspecting the TOS, we re-installed TOS 1.0 and all the errors disappeared, everthing worked perfectly. We have tried running Poolfix3.prg, Poolfix4.prg, cache90.prg and Tos14fix.prg, i.e. all the TOS 1.4 bugfixes we know of, and it made no difference, the ST still reported midi errors. The only patch we didn't try was the RS232 RTS/CTS one, but that wouldn't have any effect on the midi ports would it ?

We tried new midi leads, checked all the connections, etc etc, but the ONLY way we could get it to work correctly was by re-installing TOS 1.0 and this is the only variable in the equation.

Is anyone aware of any midi bugs in TOS 1.4, and if so, are there any patches available to fix it ?

Has anyone else experienced any midi problems with TOS 1.4 ?

The system setup is a 1040ST with 2.5Mb RAM and a mono monitor.

All ideas, suggestions, comments and wild guesses are very welcome indeed!

This is proving a real pain in the ***, so * ANY * suggestions would be greatly appreciated.

Replies either here or via e-mail if you prefer, to :
Kevan@empyr.dircon.co.uk

Thanks in advance,

Happy New Year

Hi,

Is there a prog out there that will let me enter the addresses of known bad sectors on my hard drive ? I have plenty of progs that will tell me which sectors are bad, but none that will let me mark them as bad in the FAT or SCSI.

Thanks in advance.

Kev.

I bought an ATARI SM147 some months ago and someone gave me a SVGA
monitor, so I bought a Graphic Card and the Monitor is of no use to me.
The unit is very well preserve in a like New condition, with manuals
original boxing etc, very low mileage, indeed. This monitor provides a
screen of 14" which is a relief for the eye and a sharp display for hi
res on any ST(E).
Asking for $110 plus shipping. Monitor comes with stand.

I think CodeHead's Michtron multi-line BBS runs at 9600 baud although
downloads feel like 4800.

Sam

Only problem I had with my old Mega ST 4 with TOS 1.4 was that there were
quite a lot of checksum errors in sysex-dumps, when you used Midex+ inputs
and *you had the NVDI on*. NVDI (2.5) took some punch out from midi
transmission, as when it was removed (press both shifts at bootup) all
worked fine. So boot the ST "clean", and put all ACC's and AUTO-programs
back on at a time to see their load - some of them eat processing power.
Beware screensavers, Harlekin, NVDI - cookie programs should be fine.
With Falcon: "no problemo" in sysex dumps any more.

Happy New Year (really soon now: it's 23:16 here in Helsinki)

CodeHead BBS at 818-980-6274 works at 9600 baud, but you haveto call
at 9600 not 14400. The board will connect at 14400 but you just get
junk.

6174. Re: SC1224 magnetized... help!

Newsgroup: comp.sys.atari.st
Date: 1994-12-31 23:41:24 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <xoyb4os.lmcclure@delphi.com>
Source record: 173848

In a message dated 12-31-94, Hendrik Mylius said:

"I worked for a company once which sold high-end graphics and
animation systems. Those monitors were specificly adjusted
on location, to compensate for the magnetic distortion!!!"

I once read that "pre-set" monitors and TV's sold here in the U.S. come
adjusted for the best picture when facing east.

OTOH, according to an article in Video magazine a while back, large
tube sets (i.e. 35"-40") require onsite adjustment, and therefore have
controls similar to those one finds on 17" monitors these days (sometimes
user adjustable, like the monitors, and apparently sometimes accessable
only to knowledgeable technicians).
